Married, spouse present	142	80	56.5	69	48.8	11	13.6	9.4 - 17.9

[1] Error ranges are calculated at the 90-percent confidence interval, which means that if repeated samples were drawn from the same population and an error range constructed around each sample estimate, in 9 out of 10 cases the true value based on a complete census of the population would be contained within these error ranges.

[2] "Other marital status" includes divorced, widowed, separated, and married with spouse absent.

[3] These data are for the Labor Market Area (LMA) rather than the Standard Metropolitan Statistical Area for which estimates were published in earlier years. The differences are discussed in appendix C, "Geographic Boundary Definitions".

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Table 24. Selected metropolitan areas and cities: Employment status of the experienced[1] civilian labor force by occupation, 1984 annual averages

(Numbers in thousands)

Employment status and area	Total	Managerial and professional specialty		Technical, sales, and administrative support			Service occupations	Precision production, craft, and repair	Operators, fabricators, and laborers		
		Executive, administrative, and managerial	Professional specialty	Technicians and related support	Sales	Administrative support, including clerical			Machine operators, assemblers, and inspectors	Transportation and material moving	Handlers, equipment cleaners, helpers, and laborers

[1] Excludes persons with no previous work experience.

[2] All are Standard Metropolitan Statistical Areas except those labeled Labor Market Areas (LMA's). The differences are discussed in appendix C, "Geographic Boundary Definitions".

[3] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in that area. See appendix B.

[4] Less than 500 persons or less than 0.05 percent.

NOTE: Items may not add to totals or compute to displayed rates because of rounding.

Table 25. Selected metropolitan areas and cities: Employed civilians by sex, race, Hispanic origin, and occupation, 1984 annual averages

(Percent distribution)

Population group and area	Total employed		Managerial and professional specialty		Technical, sales, and administrative support			Service occupations	Precision production, craft, and repair	Operators, fabricators, and laborers		
	Number (in thousands)	Percent	Executive, administrative, and managerial	Professional specialty	Technicians and related support	Sales	Administrative support, including clerical			Machine operators, assemblers, and inspectors	Transportation and material moving	Handlers, equipment cleaners, helpers, and laborers

[1] All are Standard Metropolitan Statistical Areas except those labeled Labor Market Areas (LMA's). The differences are discussed in appendix C, "Geographic Boundary Definitions".

[2] Less than 500 persons employed or less than 0.05 percent of total employed.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Table 26. Selected metropolitan areas and cities: Employment status of the experienced[1] civilian labor force for nonagricultural workers by industry, 1984 annual averages

[1] Excludes persons with no previous work experience.

[2] Includes self-employed and unpaid family workers and mining.

[3] Includes mining.

[4] Excludes private household workers.

[5] All are Standard Metropolitan Statistical Areas except those labeled Labor Market Areas (LMA's). The differences are discussed in appendix C, "Geographic Boundary Definitions".

[6] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in that area. See appendix B.

NOTE: Items may not add to totals or compute to displayed rates because of rounding.

[1] Includes self-employed and unpaid family workers and mining.

[2] Includes mining.

[3] Excludes private household workers.

[4] All are Standard Metropolitan Statistical Areas except those labeled Labor Market Areas (LMA's). The differences are discussed in appendix C, "Geographic Boundary Definitions".

[5] Less than 500 persons employed or less than 0.05 percent of total employed.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Appendix A. Definitions of Data Derived from the Current Population Survey

Tables showing labor force status include provisional estimates of the civilian noninstitutional population 16 years and over as well as data on the civilian labor force, unemployment rates, and labor force participation rates. Population estimates are revised by the Bureau of the Census each year, and the revised estimates are incorporated into the CPS labor force levels. This adjustment affects the estimates of labor force, employment, and unemployment but does not affect percentages such as unemployment rates, participation rates, or employment-population ratios.

The *civilian labor force* comprises all civilians classified as employed or unemployed in accordance with the criteria described below.

The *employed* are all civilians who did any work as paid employees or in their own business during the survey week, or who worked 15 hours or more as unpaid workers in an enterprise operated by a family member. Persons temporarily absent from a job because of illness, bad weather, a strike, or for personal reasons are also counted as employed whether they were paid by their employer or were seeking other jobs.

The *unemployed* are all civilians who did not work during the survey week, made specific efforts to find a job in the prior 4 weeks, and were available for work during the survey week (except for temporary illness). Persons waiting to be recalled to a job from which they had been laid off, and those waiting to report to a new job within the next 30 days, are also counted as unemployed.

Duration of unemployment represents the length of time (through the current survey week) during which persons classified as unemployed have been continuously looking for work. For persons on layoff, duration of unemployment represents the number of full weeks since the termination of their most recent employment. A period of 2 weeks or more during which a person was employed or ceased looking for work is considered to break the continuity of the present period of jobseeking. Duration of unemployment measures the length of a spell of unemployment currently in progress. Hence it should not be confused with a completed spell of unemployment.

Reasons for unemployment are divided into four major groups:
(1) Job losers—persons whose employment ended involuntarily and who immediately began looking for work, and persons on layoff; (2) job leavers—persons who quit or otherwise terminated their employment voluntarily and immediately began looking for work; (3) reentrants—persons who previously worked at a full-time job lasting 2 weeks or longer but were out of the labor force before looking for work; and (4) new entrants—persons who never worked at a full-time job lasting 2 weeks or longer.

The *unemployment rate for all civilian workers* represents the number unemployed as a percent of the civilian labor force.

The *civilian labor force participation rate* is the ratio of the civilian labor force to the civilian noninstitutional population.

The *civilian employment-population ratio* is the percentage of all employed civilians in the civilian noninstitutional population.

Hours of work statistics relate to the actual number of hours worked during the survey week. For example, persons who normally work 40 hours a week, but who were off on the Columbus Day holiday, would be reported as working 32 hours even though they were paid for the joliday. For persons working in more than one job, the figures relate to the number of hours worked in all jobs during the survey week with all hours credited to the major job.

The distribution of employment by hours worked relates to persons "at work" during the survey week. At-work data differ from data on total employment because the latter include persons in the zero-hours-worked category, "with a job but not at work." Included in this latter group are persons who were on vacation, ill, involved in a labor dispute, or otherwise absent from their jobs for voluntary, noneconomic reasons.

Persons who worked 35 hours or more in the survey week are designated as working *full time;* correspondingly, persons who worked between 1 and 34

hours are designated as working *part time*. Part-time workers are classified by their usual status at their present job (either full or part time) and by their reason for working part time during the survey week (economic or other reasons). "Economic reasons" include: Slack work, material shortages, repairs to plant or equipment, start or termination of job during the week, and inability to find full-time work. Other reasons include: Labor dispute, bad weather, own illness, vacation, demands of home, housework, school, no desire for full-time work, and full-time worker only during the peak season. Persons on full-time schedules include, in addition to those working 35 hours or more, those who worked from 1 to 34 hours for noneconomic reasons and usually work full time.

The *full-time labor force* consists of persons working on full-time schedules, persons involuntarily working part time (part time for economic reasons), and unemployed persons seeking full-time jobs. The *part-time labor force* consists of persons working part time voluntarily and unemployed persons seeking part-time work. Persons with a job but not at work during the survey week are classified according to whether they usually work full or part time.

Occupational and industry data for the employed refer to the job held during the survey week. Persons with two or more jobs are classified according to the job in which they worked the most hours during the survey week. The unemployed are classified according to the last full-time civilian job held for 2 weeks or more. Beginning with 1983 data, all occupational and industry data presented in this bulletin are coded according to the classification systems used in the 1980 census, rather than the 1970 census systems used through 1982. While this conversion had little effect on industry-related data, the new occupational categories are so radically different that their implementation represents a break in historical data series. Additional information on the 1980 census occupational and industrial classification systems appears in "Revisions in the Current Population Survey Beginning in January 1983" in the February 1983 issue of *Employment and Earnings*.

Race and Hispanic origin. Beginning with 1981 annual averages, *Geographic Profile* presents racial data for white and black workers. Before 1981, racial data were published for white and "black and other" workers. The "other" category consists primarily of American Indians, Alaskan Natives, and Asians and Pacific Islanders. *Hispanic* origin refers to persons who identified themselves in the enumeration process as Mexican, Puerto Rican, Cuban, Central or South American, or of other Hispanic origin or descent, regardless of race. Estimates of sampling errors in this report for the Hispanic population are based upon those for the "black and other" population. However, since the Hispanic population is smaller, caution should be exercised in making comparisons using these data. Separate estimates of sampling errors for the Hispanic population will be introduced with the publication of 1985 annual averages.

A more detailed description of the definitions used in this survey appears in *Concepts and Methods Used in Labor Force Statistics Derived from the Current Population Survey* (BLS Report 463) and the Explanatory Notes of the BLS monthly publication *Employment and Earnings*.

Appendix B. Sampling and Estimation Procedures and Sampling Error Tables

The estimates presented in this bulletin are based on annual averages of monthly data obtained from the CPS—a sample survey of the civilian noninstitutional population.[1] The survey is conducted each month by the Bureau of the Census for BLS, and provides comprehensive data on the labor force, the employed, and the unemployed, including such characteristics as age, sex, race, marital status, occupation, and industry. The survey also provides data on the characteristics of those not in the labor force. The information is collected by trained interviewers from a scientifically selected sample designed to represent the civilian noninstitutional population. Each month, about 60,000 occupied housing units are eligible for interview. Respondents are questioned to obtain information about the employment status of each household member 16 years of age and over for the calendar week, Sunday through Saturday, which includes the 12th of the month. This is known as the survey week. Actual field interviewing is conducted during the week which includes the 19th of the month.

Inmates of institutions, members of the Armed Forces, and persons under 14 years of age are not covered in the regular monthly enumerations; data on members of the Armed Forces and persons under 16 are excluded from the population and labor force statistics shown in this bulletin.

Sampling procedures

The 1984 sample encompasses 629 sample areas comprising over 1,000 counties and cities, with coverage in every State and the District of Columbia, and is based to a large extent on information about the distribution of the population as reported in the 1970 decennial census. These areas were selected by dividing the entire area of the United States into 1,931 primary sampling units (PSU's). With some minor exceptions, a PSU consists of a county or number of contiguous counties. Each of the SMSA's defined as of the 1970 census constitutes a separate PSU.

To improve the efficiency of the sample, the 1,931 PSU's were grouped into strata. Then, either 1 or 2 PSU's were selected from each stratum, with the probability of selection proportionate to the population size (PPS) in the PSU. PSU's in strata by themselves are self-representing (SR), and generally are the most populated PSU's in each State. Other strata were formed by combining PSU's which were similar in such characteristics as population density and growth, proportion of nonwhites, principal industry, and number of farms. PSU's selected from these strata are non-self-representing (NSR), since each one chosen represents the entire stratum.

Within each of the selected PSU's, the number of households to be enumerated each month is determined in two steps. First, a sample of census enumeration districts (ED's) is selected using PPS. ED's are administrative units and contain, on the average, about 300 households. Second, clusters of approximately four addresses to be enumerated within each designated ED are selected. Whenever possible, the four units are contiguous.

Part of the sample is changed, or rotated, each month. A primary reason for rotating the sample is to avoid cooperation problems which may result from interviewing a constant panel indefinitely. Another reason for replacing households is to reduce the cumulative effect of response biases which are sometimes observed when the same persons are interviewed indefinitely. The rotation plan provides for three-fourths of the sample to be identical from one month to the next and one-half to be identical with the same month a year earlier.

Estimating methods

Under the estimating methods used, all of the results for a given month become available simultaneously and are based on returns from the entire panel of respondents. The estimation procedure involves the weighting up, or inflating, of the data from each sample person to develop estimates for the entire population from which the sample was drawn.

[1] For a technical description of the CPS sampling and estimation procedures and variance estimation procedures, see Technical Paper 40, *The Current Population Survey, Design and Methodology* (Bureau of the Census, January 1978).

The basic weights, which are the inverse of the sampling ratios, are adjusted to better reflect the entire population, as described below.

1. *Noninterview adjustment.* The weights for all interviewed households are inflated to account for occupied sample households for which no information was obtained because of impassable roads, refusals, unavailability of the respondent, or other reasons. The proportion of sample households not interviewed generally varies from 4 to 5 percent.

2. *Ratio estimates.* The distribution of the population as estimated by the sample may differ somewhat each month, by chance, from that of the population as a whole in such characteristics as age, race, sex, and residence. Since these characteristics are closely correlated with labor force participation and other principal measurements made from the sample, the latter estimates can be substantially improved when adjusted appropriately to conform to the known distribution of these population characteristics. This is accomplished through two stages of ratio estimation as follows:

   a. *First-stage ratio estimate.* As explained above, NSR PSU's are chosen to represent not only themselves, but also other unsampled areas. The first-stage ratio adjustment procedure is designed to correct for the differences that existed at the time of the 1980 census between the distribution of the population by race and residence in the NSR sample areas and the corresponding distribution in the entire geographic area from which the NSR areas were selected. The procedure is performed twice, once at the regional level for the 4 Census regions and then for each of the 46 States which contain NSR areas. The first-stage adjustment factors are derived using the NSR PSU's in the sample, and hence, are recomputed only when a new PSU is rotated into the sample.

   b. *Second-stage ratio estimate.* This stage is designed to adjust the inflated first-stage estimates to conform to the most recent estimate of the entire U.S. population, and is conducted in two steps. In the first step, the sample estimates for all age-sex-race groups within each State and the District of Columbia are prorated to a monthly independent estimate of the population 16 years and over for that State. The second step is applied to a specific age-sex-race group for sample persons across all States and is a weighting of estimates from the first step to a nationwide independent estimate of the civilian noninstitutional population for each of 68 age-sex-race groups. Beginning with the 1981 annual averages, the race groups used in this step have been changed from white/nonwhite to black/nonblack. (See appendix A.)

      The entire second-stage ratio estimation procedure is iterated six times, and when completed, insures that the adjusted sample population estimates, both for the States and the national age-sex-race categories, will be virtually equal to the independent population estimates for these categories.

      The monthly independent State controls for the civilian noninstitutional population 16 years and over are based on an arithmetic extrapolation of the trend in their growth from the April 1, 1980, census count through the latest available provisional July 1 estimate, with all State estimates prorated to a current estimate of the U.S. population. A description of the methodology used to derive the independent national age-sex-race estimates and State totals may be obtained from the Chief of the Population Division, U.S. Bureau of the Census, Washington, D.C. 20233.

3. *Composite estimate procedure.* In deriving the final statistics for a given month, a composite estimating procedure is used which takes account of net changes in the sample results from the previous month for the continuing households of the sample (75 percent), as well as the sample results from all households for the current month. Almost all estimates of month-to-month changes are improved by this procedure. Most estimates of levels are also improved, but to a lesser extent.

Reliability of the estimates

Since the estimates in this report are based upon a sample of the population rather than a complete count, they may differ from the figures that would have been obtained if it had been possible to take a complete census using the same schedules and procedures as are used in the CPS. There are two types of errors in an estimate based on a sample survey—sampling and nonsampling. The sampling error tables in this report primarily indicate the magnitude of the sampling error. They also partially measure the effect of some nonsampling errors in response and enumeration, but do not measure any systematic biases in data.

In general, the error of a sample estimate varies inversely with the size of the sample and directly with the size of the estimate. Hence, an estimate for a subgroup constituting a small proportion of a population will tend to have a smaller absolute (and larger relative) error than an estimate for a subgroup constituting a large proportion of that same population.

Reliability standards

Since the CPS is designed to produce both national and State estimates, the proportion of the total population sampled, and hence, the sampling ratios differ among the States. In general, the smaller the population of the State, the larger the sampling proportion. For example, in Vermont approximately 1 in every 300 households was sampled each month in 1984, whereas in New York the sample covered about 1 in every 1,600 households. Nevertheless, the size of the sample in New York is 4 times larger than in Vermont because New York has a larger percentage of the national population.

Prior to 1976, the sampling ratio for each household was the same in each State, approximately 1 in 1,500. Since then, the samples have been augmented in many of the smaller States to improve the reliability of the CPS data. This augmentation has affected the sampling ratios in these States, so now the probability of selecting a particular household varies considerably from State to State.

Differences in the probability of selecting each household in each State are necessary to obtain total unemployment levels meeting a minimum level of reliability—a maximum expected annual coefficient of variation of 10 percent, at one standard error, given a 6 percent unemployment rate. Before CPS labor force data for a State or area can be used as the official estimates in the Federal-State cooperative program, the size of the sample for that area must be large enough to produce estimates meeting that minimum standard of reliability.

Publication standards for State and area CPS data

In order to achieve comparability of the data for regions, divisions, States, SMSA's, and cities for publication purposes, a unique requirement for minimum labor force, employment, and unemployment had to be developed for each area. This requirement is based on the known differences in sampling ratios among these areas. Before estimates are published for a specific category, a predetermined "critical cell" must contain at least 30 sample cases. In addition, estimates are not published when they do not meet the comparable minimum publication standard for national CPS data. As a result of these two requirements, minimum bases for publication have been developed for each area. Table B-1 lists the minimum necessary base for publication of data in each of the regions, divisions, States, the District of Columbia, and the metropolitan areas and cities appearing in this bulletin.

Estimates are not shown when they do not meet the minimum base for the State or area listed in table B-1. In tables showing the labor force status of the population, the critical cell is the size of the labor force of the particular population group. In all other tables, the determining factor or critical cell is the size of the base of the distribution—i.e., the size of total employment or unemployment for that area or population subgroup. Data are not published for any cell with fewer than 500 persons or less than 0.5 percent.

Using the sampling error tables

The sampling error tables (tables B-2 through B-25) can be used directly to develop 90-percent confidence intervals for sample estimates. (A sampling error equals 1.645 times one standard error.) They indicate the order of magnitude of the sampling error rather than the precise amount of the possible error in an estimate.

Table B-10 shows that an estimate of 50,000 unemployed persons (total or white) in Alabama will have an absolute sampling error of 9,000, and a relative sampling error of 18 percent, while an estimate of 100,000 unemployed persons in Alabama has an absolute sampling error of 13,000 and a relative sampling error of 13 percent.

The statement that unemployment in Alabama is between 41,000 and 59,000 in the first instance, and between 87,000 and 113,000 in the second, is made with 90-percent confidence. If repeated samples were drawn from the same population and a confidence interval (based on the sample estimate plus and minus the sampling error) were constructed for each sample estimate, the true value based on a complete census of the population would be contained within 90 percent of these intervals. Hence, we can be 90-percent confident that the interval constructed does, in fact, contain the true value.

To calculate a 68-percent confidence interval (two chances out of three), multiply the sampling error shown by 0.6. To convert the sampling error to 95-percent confidence (19 chances out of 20), multiply the sampling error by 1.19. For the example given above, the sampling error at 90-percent confidence was 9,000. At 68-percent confidence, the error would be about 5,400 (9,000 X 0.6 = 5,400). At 95-percent confidence, the error would be about 10,700 (9,000 X 1.19 = 10,710).

To compute the error of a difference from the tables, an additional step is required. If, for instance, one wishes to know whether a change in the unemployment rate from 1983 to 1984 in a particular area is statistically significant, or whether the difference in the unemployment rate between two areas or population groups is statistically meaningful, the significance of the difference needs to be computed.

To test for the significance of a difference, the following formula should be used:

$$E_d = \sqrt{E_1^2 + E_2^2 - C}$$

where. E_1 = the sampling error of one group or year
E_2 = The sampling error of another group or year
C = the covariance (or relationship) term between E_1 and E_2
E_d = the sampling error of the difference

The E_1 and the E_2 must be found in the appropriate *Geographic Profile* for each year, since the size of the samples and, consequently, sampling errors may differ from year to year. Estimates for the "C" term for areas in this report are not available. (If the relationship between the two groups or years is small, the "C" term may be ignored. If, however, there is a strong positive relationship between the two groups, then the error computed without the "C" term will be overstated.) An example will show how this significance test is applied. Suppose one wished to know whether a hypothetical change in the CPS unemployment rate in Alaska from 10.0 percent in 1979 to 8.0 percent in 1984 is significant. Assume that the labor force was about 100,000 in both years. Table B-8 in the 1979 *Geographic Profile*

gives the error for a 10.0-percent unemployment rate as 1.11, and table B-14 in this year's *Geographic Profile* gives the error for an 8.0-percent unemployment rate as 1.40. Using the formula described above, the following would result:

$$E_1 = 1.11 \qquad E_2 = 1.40$$

$$E_1^2 + E_2^2 = 3.1921$$

$$\sqrt{3.1921} = 1.79$$

Assuming a negligible "C" term, the error of the difference is about 1.8. Since the actual change (2.0 percent) exceeds the error of the difference, it can be stated, with 90-percent confidence, that the difference in rates is attributable to factors other than sampling error alone.

To derive a sampling error for a given estimate, it may be necessary to use interpolation or extrapolation. For example, table B-10 contains no sampling error for an estimate of 150,000 unemployed persons in Alabama. The following formula shows how to interpolate for an estimate of 150,000 in Alabama:

$$E_S = [[(S - G) \ / \ (F - G)] \times (X - Y)] + Y$$

where: F = published size immediately above the size desired (200,000)

G = published size immediately below the size desired (100,000)

S = size desired (150,000)

X = error of the F (18,000)

Y = error of G (13,000)

E_S = error of S (15,500)

If the sample estimate lies outside the boundaries of the error tables, extrapolation can be used to approximate the sampling error. The formula for extrapolation is the same as that for interpolation; however, the "F" term is the highest value in the table and the "G" term becomes the next highest value.

Derivation of sampling errors

These State and area sampling errors are developed using a generalized procedure and are not based on the sample data for each individual area. As with all sampling error tables produced for CPS State and area data, a number of approximations were required in order to derive sampling errors that would be applicable to a wide variety of items. As a result, these sampling errors provide an indication of the order of magnitude of a sampling error rather than a precise sampling error for any specific item. The sampling error tables are derived from standard error equations and special parameters developed by the Bureau of the Census. These may be obtained from BLS on request.

Appendix C. Geographic Boundary Definitions

This appendix lists the States composing the Census divisions and regions. It also provides the geographic definitions of Standard Metropolitan Statistical Areas (SMSA's) and Labor Market Areas (LMA's). Revised area definitions will be introduced with the publication of 1985 annual data.

The Census regions and divisions and the States they comprise are:

Northeast
- New England
  - Maine
  - New Hampshire
  - Vermont
  - Massachusetts
  - Rhode Island
  - Connecticut
- Middle Atlantic
  - New York
  - New Jersey
  - Pennsylvania

Midwest
- East North Central
  - Ohio
  - Indiana
  - Illinois
  - Michigan
  - Wisconsin
- West North Central
  - Iowa
  - Missouri
  - Nebraska
  - Kansas
  - Minnesota
  - North Dakota
  - South Dakota

South
- South Atlantic
  - Delaware
  - Maryland
  - District of Columbia
  - Virginia
  - West Virginia
  - North Carolina
  - South Carolina
  - Georgia
  - Florida
- East South Central
  - Kentucky
  - Tennessee
  - Alabama
  - Mississippi
- West South Central
  - Arkansas
  - Louisiana
  - Oklahoma
  - Texas

West
- Mountain
  - Montana
  - Wyoming
  - Colorado
  - Utah
  - Idaho
  - Arizona
  - Nevada
  - New Mexico
- Pacific
  - California
  - Hawaii
  - Washington
  - Oregon
  - Alaska

The Department of Labor has used LMA's for a number of years for various administrative and programmatic purposes. The boundaries for almost all LMA's are the same as those for SMSA's, as established by the Office of Management and Budget. SMSA boundaries are defined using a specific set of criteria developed for that purpose. LMA's are determined by the State employment security agencies, using rules established by the Department of Labor. Since many LMA's were established before they were designated as an SMSA, there are a few areas where boundary differences reflect this initial classification discrepancy.

In general, an SMSA is defined as a county containing at least one city with 50,000 inhabitants or more, or several economically and socially related contiguous counties with at least one city of 25,000 inhabitants or more. In the New England States, where SMSA's are

composed of cities and towns, the minimum population size is 75,000.

The boundaries of SMSA's are occasionally revised. The table that follows compares the boundaries of 30 large SMSA's in 1970 and 1973 (the current SMSA boundaries) with the current LMA boundaries. With the exception of Minneapolis-St. Paul and New York, estimates in section III refer to SMSA's.

Table C-1. Geographic boundaries of metropolitan areas (SMSA's and LMA's)

Area	SMSA 1970 definition	SMSA 1973 definition	LMA definition[1]
Anaheim-Santa Ana-Garden Grove ..	Orange County	Same	Same
Atlanta	Counties of Cobb, Clayton, DeKalb, Fulton, Gwinnett	1970 definition plus counties of Butts, Cherokee, Douglas, Fayette, Forsyth, Henry, Newton, Paulding, Rockdale, Walton	1973 definition
Baltimore	City of Baltimore, Counties of Anne Arundel, Baltimore, Carroll, Harford, and Howard	Same	Same
Boston	Suffolk County and parts of Counties of Essex, Middlesex, Norfolk, Plymouth	1970 definition plus Boxford Town in Essex County; Towns of Acton, Boxborough, Carlisle, Holliston in Middlesex County; Bellingham, Foxborough, Franklin, Medway, Stoughton, Wrentham in Norfolk County; and Abington, Hanson, Kingston in Plymouth County.	1973 definition
Buffalo	Counties of Erie, Niagara	Same	Same
Chicago	Counties of Cook, Du Page, Kane, Lake, McHenry, Will	Same	Same
Cincinnati	Ohio portion: Counties of Clermont, Hamilton, Warren Kentucky portion: Counties of Boone, Campbell, Kenton Indiana portion: Dearborn County	Same	Same
Cleveland	Counties of Cuyahoga, Geauga, Lake, Medina	Same	Same
Dallas-Fort Worth	Counties of Collin, Dallas, Denton, Ellis, Kaufman, Rockwall, Johnson, Tarrant	1970 definition plus Counties of Hood, Parker, and Wise	Same
Denver-Boulder	Counties of Adams, Arapahoe, Boulder, Jefferson, Denver	1970 definition plus Counties of Douglas, Gilpin	1973 definition plus Clear Creek County
Detroit	Counties of Macomb, Oakland, Wayne	1970 definition plus Counties of Lapeer, Livingston, St. Clair	1973 definition
Houston	Counties of Brazoria, Fort Bend, Harris, Liberty, Montgomery	1970 definition plus Waller County	1973 definition
Indianapolis	Counties of Boone, Hamilton, Hancock, Hendricks, Johnson, Marion, Morgan, Shelby	Same	Same
Kansas City	Missouri portion: Counties of Cass, Clay, Jackson, Platte Kansas portion: Counties of Johnson, Wyandotte	1970 definition plus Ray County, Mo.	1973 definition
Los Angeles-Long Beach	Los Angeles County	Same	Same
Miami	Dade County	Same	Same
Milwaukee	Counties of Milwaukee, Ozaukee, Washington, Waukesha	Same	Same

Preface

Data on labor force, employment, and unemployment in State and sub-State areas are available from two major sources—the Current Population Survey (CPS) and the Federal-State Cooperative Program. This bulletin presents data from the CPS for regions, States, and selected large metropolitan areas and central cities. It provides 1985 annual averages for the employed and the unemployed by selected demographic and economic characteristics based on population counts projected from the 1980 decennial census.

Comparable data for 1980-84 were published in *Geographic Profile of Employment and Unemployment* as follows: 1984, Bulletin 2234; 1983, Bulletin 2216; 1982, Bulletin 2170; and 1981 and 1980, Bulletin 2156. Bulletin 2156 also provided instructions for adjusting 1970 census-based data for earlier years to reflect 1980 census population counts.

Data for metropolitan areas are for Standard Metropolitan Statistical Areas (SMSA's) and Labor Market Areas (LMA's). Revised definitions for metropolitan areas based on guidelines and standards established by the Office of Management and Budget in 1983 will be reflected in the 1986 annual averages. The 1985 data for metropolitan areas based on revised definitions are not consistent with the State data in this publication, and hence, have not been used.

Data published in this bulletin reflect the 1980 census-based redesign of the CPS sample which was phased in during April 1984 through July 1985. This redesign affected the sample areas chosen as well as the estimation procedure. Subnational data reflect new controls for the population 16 years and over, as well as revised Hispanic population controls introduced in January 1985. (See appendix B).

The official Bureau of Labor Statistics estimates for States, metropolitan areas, and central cities, which are the basis for determining the eligibility of an area for benefits under Federal economic assistance programs, result from the Federal-State Cooperative Program. BLS is responsible for establishing the estimating procedures; the State employment security agencies are responsible for developing the estimates. For all States, the District of Columbia, the Los Angeles SMSA, and New York City, the official annual average estimates are obtained directly from the CPS. For the remaining metropolitan areas and cities, the official annual average estimates are derived using a standardized procedure. Data from the CPS for metropolitan areas and cities in this bulletin are not the official BLS estimates and are provided because they are the only current source of information on demographic and economic characteristics.

Data for two metropolitan areas, New York and Minneapolis-St. Paul, relate to the LMA rather than the SMSA definition. For further information on geographic areas, see appendix C.

This bulletin was prepared in the Division of Data Development and Users' Services in collaboration with the Division of Local Area Unemployment Statistics.

Material in this publication is in the public domain and, with appropriate credit, may be reproduced without permission.

Geographic Profile of Employment and Unemployment, 1985

The Current Population Survey (CPS) is the regular monthly survey of about 59,500 households from which the national unemployment rate is derived. (See appendix A for definitions and concepts in the CPS, and appendix B for a description of estimation procedures.) Data in this bulletin reflect the redesign of the CPS sample which produced more accurate State estimates than previously with no increase in the overall national sample size. The data also reflect changes in the estimation procedure which provide improved estimates of the Hispanic population.

Annual average estimates of the labor force by demographic characteristics (age, sex, race, and Hispanic origin) and the economic characteristics of the employed and unemployed are published in this bulletin only if they meet the BLS standards of reliability for publication. (See appendix B for an explanation of the BLS standards for publication of CPS data.) Estimates for census regions and divisions are shown in section I; States are shown in section II; and metropolitan areas and cities are shown in section III.

Since these estimates are based on a survey rather than on a complete census of the population, they are subject to sampling error. Consequently, error ranges have been provided, at a 90-percent confidence interval, for the unemployment rates in the first table of sections I, II, and III. In addition, appendix B provides tables from which the sampling error ranges can be obtained for the data in other tables in these sections. For the first time, separate estimates of sampling errors for data on the Hispanic-origin population are available.

Other marital status[3]	4,677	2,635	56.3	2,428	51.9	207	7.9	7.2 - 8.5

[1] Error ranges are calculated at the 90-percent confidence interval, which means that if repeated samples were drawn from the same population and an error range constructed around each sample estimate, in 9 out of 10 cases the true value based on a complete census of the population would be contained within these error ranges.

[2] Because of separate processing and weighting procedures, totals for the United States differ from the results obtained by aggregating the totals for regions and States.

[3] "Other marital status" includes divorced, widowed, separated, and married with spouse absent.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups. Regional totals for labor force status categories may not equal those published earlier this year (USDL 86-83) because estimates for these areas have been subsequently revised.

Table 2. Census regions and divisions: Full- and part-time status of the civilian labor force by sex, age, race, and Hispanic origin, 1985 annual averages

[1] Employed persons with a job but not at work are distributed according to whether they usually work full- or part-time.

[2] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in that area. See appendix B.

NOTE: Items may not add to totals or compute to displayed rates because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

[1] Less than 500 persons employed or less than 0.05 percent of total employed.

[2] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in that area. See appendix B.

NOTE: Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Table 5. Census regions and divisions: Employment status of the experienced[1] civilian labor force for private nonagricultural wage and salary workers, excluding private household workers, by industry, 1985 annual averages

[1] Excludes persons with no previous work experience.

[2] Includes toys, amusement, and sporting goods.

[3] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in that area. See appendix B.

NOTE: Items may not add to totals or compute to displayed rates because of rounding.

[1] Includes toys, amusement, and sporting goods.

[2] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in that area. See appendix B.

[3] Less than 500 persons employed or less than 0.05 percent of total employed.

NOTE: Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

West	123	61	33	5	24
Mountain	33	18	7	2	6
Pacific	90	43	26	3	18

[1] Includes industrial disputes.

[2] Less than 500 persons.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Other marital status[2]	54	31	58.1	29	54.3	2	6.5	4.1 - 8.9

[1] Error ranges are calculated at the 90-percent confidence interval, which means that if repeated samples were drawn from the same population and an error range constructed around each sample estimate, in 9 out of 10 cases the true value based on a complete census of the population would be contained within these error ranges.

[2] "Other marital status" includes divorced, widowed, separated, and married with spouse absent.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Table 13. States: Full- and part-time status of the civilian labor force by sex, age, race, and Hispanic origin, 1985 annual averages

Wyoming	10	8	1	1	12.3	[2]	[2]	[2]	[2]

[1] Employed persons with a job but not at work are distributed according to whether they usually work full- or part-time.

[2] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in that area. See appendix B.

[3] Less than 500 persons or less than 0.05 percent.

NOTE: Items may not add to totals or compute to displayed rates because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Table 14. States: Employment status of the experienced[1] civilian labor force by occupation, 1985 annual averages

(Numbers in thousands)

Employment status and State	Total[1]	Managerial and professional specialty		Technical, sales, and administrative support			Service occupations	Precision production, craft, and repair	Operators, fabricators, and laborers			Farming, forestry, and fishing
		Executive, administrative, and managerial	Professional specialty	Technicians and related support	Sales	Administrative support, including clerical			Machine operators, assemblers, and inspectors	Transportation and material moving	Handlers, equipment cleaners, helpers, and laborers

[1] Less than 500 persons employed or less than 0.05 percent of total employed

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Table 16. States: Employment status of the experienced[1] civilian labor force by industry, 1985 annual averages

(Numbers in thousands)

Employment status and State	Total[2]	Nonagricultural industries											Agriculture
		Total[3]	Private nonagricultural wage and salary workers									Government	
			Total[4]	Construction	Manufacturing			Transportation, communications, and public utilities	Trade	Finance, insurance, and real estate	Services[5]		
					Total	Durable goods	Nondurable goods

[1] Excludes persons with no previous work experience.

[2] Includes private household workers, self-employed and unpaid family workers, and mining.

[3] Includes self-employed and unpaid family workers and mining.

[4] Includes mining.

[5] Excludes private household workers.

[6] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in that area. See appendix B.

[7] Less than 500 persons or less than 0.05 percent.

NOTE: Items may not add to totals or compute to displayed rates because of rounding.

[1] Includes private household workers, self-employed and unpaid family workers, and mining.
[2] Includes self-employed and unpaid family workers and mining.
[3] Includes mining.
[4] Excludes private household workers.
[5] Less than 500 persons employed or less than 0.05 percent of total employed.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Table 18. States: Civilians at work by sex, age, race, Hispanic origin, and hours of work, 1985 annual averages

(Numbers in thousands)

Population group and State	Total at work	Hours of work								Average hours	
		1-14 hours	15-29 hours	30-34 hours	35 hours and over	35-39 hours	40 hours	41-48 hours	49 hours and over	Total	Full-time schedules[1]

[1] Refers to persons who worked 35 hours or more during the survey week.

[2] Less than 500 persons or less than 0.05 percent.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Table 19. States: Civilians at work 1 to 34 hours by sex, race, reason for working less than 35 hours, and usual status, 1985 annual averages

(Numbers in thousands)

Population group and State	Usually work full time								Usually work part time				
	Total	Slack work or material shortages	Job started or terminated	Holiday	Bad weather	Own illness	On vacation	Other[1]	Total	Slack work or only find part-time	Does not want full-time work[2]	Full-time work less than 35 hours	Other

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Virginia	62	100.0	47.8	32.2	20.0	8.5
Hispanic origin						
California	266	100.0	44.5	30.6	24.9	12.8
Florida	36	100.0	43.5	37.7	18.9	5.5
Illinois	38	100.0	36.6	32.7	30.7	16.8
New Jersey	30	100.0	42.8	34.6	22.5	12.0
New Mexico	23	100.0	49.1	24.5	26.4	17.0
New York	96	100.0	37.2	28.3	34.5	16.7
Texas	172	100.0	53.9	30.1	16.0	7.1

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Section III. Estimates for Metropolitan Areas and Cities

Table 23. Selected metropolitan areas and cities: Employment status of the civilian noninstitutional population by sex, age, race, Hispanic origin, and marital status, 1985 annual averages

Single (never married)	105	61	58.3	52	49.5	9	15.1	9.6	- 20.6
Married, spouse present	139	81	58.5	76	54.9	5	6.2	3.0	- 9.5

[1] Error ranges are calculated at the 90-percent confidence interval, which means that if repeated samples were drawn from the same population and an error range constructed around each sample estimate, in 9 out of 10 cases the true value based on a complete census of the population would be contained within these error ranges.

[2] "Other marital status" includes divorced, widowed, separated, and married with spouse absent.

[3] These data are for the Labor Market Area (LMA) rather than the Standard Metropolitan Statistical Area (SMSA) for which estimates were published in earlier years. The differences are discussed in appendix C, "Geographic Boundary Definitions".

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Table 24. Selected metropolitan areas and cities: Employment status of the experienced[1] civilian labor force by occupation, 1985 annual averages

(Numbers in thousands)

Employment status and area	Total	Managerial and professional specialty		Technical, sales, and administrative support			Service occupations	Precision production, craft, and repair	Operators, fabricators, and laborers		
		Executive, administrative, and managerial	Professional specialty	Technicians and related support	Sales	Administrative support, including clerical			Machine operators, assemblers, and inspectors	Transportation and material moving	Handlers, equipment cleaners, helpers, and laborers

[1] Excludes persons with no previous work experience.

[2] All are Standard Metropolitan Statistical Areas (SMSA's) except those labeled Labor Market Areas (LMA's). The differences are discussed in appendix C, "Geographic Boundary Definitions".

[3] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in that area. See appendix B.

NOTE: Items may not add to totals or compute to displayed rates because of rounding.

Table 25. Selected metropolitan areas and cities: Employed civilians by sex, race, Hispanic origin, and occupation, 1985 annual averages

(Percent distribution)

Population group and area	Total employed		Managerial and professional specialty		Technical, sales, and administrative support			Service occupations	Precision production, craft, and repair	Operators, fabricators, and laborers		
	Number (in thousands)	Percent	Executive, administrative, and managerial	Professional specialty	Technicians and related support	Sales	Administrative support, including clerical			Machine operators, assemblers, and inspectors	Transportation and material moving	Handlers, equipment cleaners, helpers, and laborers

[1] All are Standard Metropolitan Statistical Areas (SMSA's) except those labeled Labor Market Areas (LMA's). The differences are discussed in appendix C, "Geographic Boundary Definitions".

[2] Less than 500 persons employed or less than 0.05 percent of total employed.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

[1] Excludes persons with no previous work experience.
[2] Includes self-employed and unpaid family workers and mining.
[3] Includes mining.
[4] Excludes private household workers.
[5] All are Standard Metropolitan Statistical Areas (SMSA's) except those labeled Labor Market Areas (LMA's). The differences are discussed in appendix C, "Geographic Boundary Definitions".
[6] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in that area. See appendix B.
[7] Less than 500 persons or less than 0.05 percent.

NOTE: Items may not add to totals or compute to displayed rates because of rounding.

[1] Includes self-employed and unpaid family workers and mining.
[2] Includes mining.
[3] Excludes private household workers.
[4] All are Standard Metropolitan Statistical Areas (SMSA's) except those labeled Labor Market Areas (LMA's). The differences are discussed in appendix C, "Geographic Boundary Definitions".
[5] Less than 500 persons employed or less than 0.05 percent of total employed.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Appendix A. Definitions of Data Derived from the Current Population Survey

Tables showing labor force status include provisional estimates of the civilian noninstitutional population 16 years and over as well as data on the civilian labor force, unemployment rates, and labor force participation rates. Population estimates are revised by the Bureau of the Census each year, and the revised estimates are incorporated into the CPS labor force levels. This adjustment affects the estimates of labor force, employment, and unemployment but does not affect percentages such as unemployment rates, participation rates, or employment-population ratios.

The *civilian labor force* comprises all civilians classified as employed or unemployed in accordance with the criteria described below.

The *employed* are all civilians who did any work as paid employees or in their own business during the survey week, or who worked 15 hours or more as unpaid workers in an enterprise operated by a family member. Persons temporarily absent from a job because of illness, bad weather, a strike, or for personal reasons are also counted as employed whether they were paid by their employer or were seeking other jobs.

The *unemployed* are all civilians who did not work during the survey week, made specific efforts to find a job in the prior 4 weeks, and were available for work during the survey week (except for temporary illness). Persons waiting to be recalled to a job from which they had been laid off, or waiting to report to a new job within 30 days, need not be looking for work to be classified as unemployed.

Duration of unemployment represents the length of time (through the current survey week) during which persons classified as unemployed have been continuously looking for work. For persons on layoff, duration of unemployment represents the number of full weeks since the termination of their most recent employment. A period of 2 weeks or more during which a person was employed or ceased looking for work is considered to break the continuity of the present period of jobseeking. Duration of unemployment measures the length of a spell of unemployment currently in progress. Hence it should not be confused with a completed spell of unemployment.

Reasons for unemployment are divided into four major groups:
(1) Job losers—persons whose employment ended involuntarily and who immediately began looking for work, and persons on layoff; (2) job leavers—persons who quit or otherwise terminated their employment voluntarily and immediately began looking for work; (3) reentrants—persons who previously worked at a full-time job lasting 2 weeks or longer but were out of the labor force before looking for work; and (4) new entrants—persons who never worked at a full-time job lasting 2 weeks or longer.

The *unemployment rate for all civilian workers* represents the number unemployed as a percent of the civilian labor force.

The *civilian labor force participation rate* is the ratio of the civilian labor force to the civilian noninstitutional population.

The *civilian employment-population ratio* is the percentage of all employed civilians in the civilian noninstitutional population.

Hours of work statistics relate to the actual number of hours worked during the survey week. For example, persons who normally work 40 hours a week, but who were off on the Columbus Day holiday, would be reported as working 32 hours even though they were paid for the joliday. For persons working in more than one job, the figures relate to the number of hours worked in all jobs during the survey week with all hours credited to the major job.

The distribution of employment by hours worked relates to persons "at work" during the survey week. At-work data differ from data on total employment because the latter include persons in the zero-hours-worked category, "with a job but not at work." Included in this latter group are persons who were on vacation, ill, involved in a labor dispute, or otherwise absent from their jobs for voluntary, noneconomic reasons.

Persons who worked 35 hours or more in the survey week are designated as working *full time;* correspondingly, persons who worked between 1 and 34

hours are designated as working *part time*. Part-time workers are classified by their usual status at their present job (either full or part time) and by their reason for working part time during the survey week (economic or other reasons). "Economic reasons" include: Slack work, material shortages, repairs to plant or equipment, start or termination of job during the week, and inability to find full-time work. Other reasons include: Labor dispute, bad weather, own illness, vacation, demands of home, housework, school, no desire for full-time work, and full-time worker only during the peak season. Persons on full-time schedules include, in addition to those working 35 hours or more, those who worked from 1 to 34 hours for noneconomic reasons and usually work full time.

The *full-time labor force* consists of persons working on full-time schedules, persons involuntarily working part time (part time for economic reasons), and unemployed persons seeking full-time jobs. The *part*-voluntarily and unemployed persons seeking part-time work. Persons with a job but not at work during the survey week are classified according to whether they usually work full or part time.

Occupational and industry data for the employed refer to the job held during the survey week. Persons with two or more jobs are classified according to the job in which they worked the most hours during the survey week. The unemployed are classified according to the last full-time civilian job held for 2 weeks or more. Beginning with 1983 data, all occupational and industry data presented in this bulletin are coded according to the classification systems used in the 1980 census, rather than the 1970 census systems used through 1982. While this conversion had little effect on industry-related data, the new occupational categories are so radically different that their implementation represents a break in historical data series. Additional information on the 1980 census occupational and industrial classification systems appears in "Revisions in the Current Population Survey Beginning in January 1983" in the February 1983 issue of *Employment and Earnings*.

Race and Hispanic origin. Beginning with 1981 annual averages, *Geographic Profile* presents racial data for white and black workers. Before 1981, racial data were published for white and "black and other" workers. The "other" category consists primarily of American Indians, Alaskan Natives, and Asians and Pacific Islanders. *Hispanic* origin refers to persons who identified themselves in the enumeration process as Mexican, Puerto Rican, Cuban, Central or South American, or of other Hispanic origin or descent, regardless of race.

A more detailed description of the definitions used in this survey appears in *Concepts and Methods Used in Labor Force Statistics Derived from the Current Population Survey* (BLS Report 463) and the Explanatory Notes of the BLS monthly publication *Employment and Earnings*.

Appendix B. Sampling and Estimation Procedures and Sampling Error Tables

The estimates presented in this bulletin are based on annual averages of monthly data obtained from the CPS—a sample survey of the civilian noninstitutional population. The survey is conducted each month by the Bureau of the Census for BLS, and provides comprehensive data on the labor force, the employed, and the unemployed, including such characteristics as age, sex, race, marital status, occupation, and industry. The survey also provides data on the characteristics of those not in the labor force. The information is collected by trained interviewers from a scientifically selected sample designed to represent the civilian noninstitutional population. Each month, about 59,500 occupied housing units are eligible for interview. Respondents are interviewed using a standardized questionnaire to obtain information about the employment status of each household member 16 years of age and over. The reference period is the calendar week, Sunday through Saturday, which includes the 12th of the month. This is known as the survey week. Actual field interviewing is conducted during the week which includes the 19th of the month.

Inmates of institutions, members of the Armed Forces, and persons under 14 years of age are not covered in the regular monthly enumerations; data on members of the Armed Forces and persons under 16 are excluded from the population and labor force statistics shown in this bulletin.

Sampling procedures

The 1985 sample, which reflects the CPS redesign, encompasses 729 sample areas comprising over 1,000 counties and cities, with coverage in every State and the District of Columbia. It is based to a large extent on information about the distribution of the population as reported in the 1980 decennial census [1]. These areas were selected by dividing the entire area of the United States into 1,973 primary sampling units (PSU's). With some minor exceptions, a PSU consists of a county or number of contiguous counties. Most metropolitan areas constitute separate PSU's.

To improve the efficiency of the sample, the 1,973 PSU's were grouped into strata within each State. Then, one PSU was selected from each stratum, with the probability of selection proportionate to the population size in the PSU. PSU's in strata by themselves are self-representing, and generally are the most populated PSU's in each State. Other strata were formed by combining PSU's which were similar in such characteristics as population growth, proportion of blacks and Hispanics, occupation/industry, and age/sex distribution. PSU's selected from these strata are non-self-representing, since each one chosen represents the entire stratum.

Within each of the selected PSU's, the number of households to be enumerated each month is determined in two steps. First, a sample of census enumeration districts (ED's) is selected using the population size probability selection procedures. ED's are administrative units and contain, on the average, about 300 households. Second, clusters of approximately four addresses (contiguous, wherever possible) to be enumerated within each designated ED are selected.

Part of the sample is changed, or rotated, each month. A primary reason for rotating the sample is to minimize the lack of cooperation which may result from interviewing a constant panel indefinitely. Another reason for replacing households is to reduce the cumulative effect of response biases which are sometimes observed when the same persons are interviewed indefinitely. The rotation plan provides for three-fourths of the sample to be identical from one month to the next and one-half to be identical with the same month a year earlier.

Estimating methods

Under the estimating methods used, all of the results for a given month become available simultaneously and are based on returns from the entire panel of respondents. The estimation procedure involves the weighting up, or inflating, of the data from each sample person to develop estimates for the entire population from which the sample was drawn.

The basic weights, which are the inverse of the sampling

[1] A description of the scope and nature of the CPS redesign and phase-in appears in "Redesign of the Sample for the Current Population Survey," *Employment and Earnings, May 1984, pp. 7-10.*

ratios (defined as the number of sample households divided by total households in the State), are adjusted to better reflect the entire population, as described below.

1. *Noninterview adjustment.* The weights for all interviewed households are inflated to account for occupied sampled households for which no information was obtained because of impassable roads, refusals, unavailability of the respondent, or other reasons. The proportion of sample households not interviewed for these reasons generally varies from 4 to 5 percent.

2. *Ratio estimates.* The distribution of the population as estimated by the sample may differ somewhat each month, by chance, from that of the population as a whole in such characteristics as age, sex, ethnic origin, and residence. Since these characteristics are closely correlated with labor force participation and other principal measurements made from the sample, the latter estimates can be substantially improved when adjusted appropriately to conform to the known distribution of these population characteristics. This is accomplished through two stages of ratio estimation as follows:

   a. *First-stage ratio estimate.* As explained above, non-self-representing PSU's are chosen to represent not only themselves, but also other unsampled areas. The first-stage ratio adjustment procedure is designed to correct for the differences that existed at the time of the 1980 census between the distribution of the population by race in the non-self-representing sample areas and the corresponding distribution in the entire geographic area from which the non-self-representing areas were selected. The adjustment is made at the State level for each of the 43 States which contain non-self-representing areas by the race categories of black and non-black. The first-stage adjustment factors are derived using the non-self-representing PSU's in the sample, and hence, are recomputed only when a new PSU is rotated into the sample.

   b. *Second-stage ratio estimate.* This stage is designed to adjust the inflated first-stage estimates to conform to the most recent distribution of the entire U.S. population by age-sex-race-Hispanic origin and is conducted in three steps.

      In the first step, the sample population and labor force estimates are adjusted within each State and the District of Columbia using an independent control for the population 16 years and over for that area. In effect, the ratio of the independent and sample populations is used to inflate the sample labor force estimates. The second step involves an adjustment by Hispanic origin to a national estimate for eight age-sex categories by Hispanic and non-Hispanic origin[2]. In the third step, a national adjustment is made by the race categories of white, black, and other races to independent estimates by age and sex. The white and black categories contain 32 age-sex groups each while the other races category has 6 age-sex cells.

      The entire second-stage ratio estimation procedure is iterated six times, and when completed, insures that the adjusted sample population estimates, both for the States and the national age-sex-race-origin categories, will be virtually equal to the independent population estimates for these categories.

      The monthly independent State controls for the civilian noninstitutional population 16 years and over are based on an arithmetic extrapolation of the trend in population growth from the April 1, 1980, census through the July 1 provisional estimate for the current year, with all State estimates prorated to a current estimate of the U.S. population. A description of the methodology used to derive the independent national age-sex-race-Hispanic origin estimates and State totals may be obtained from the Chief of the Population Division, U.S. Bureau of the Census, Washington, D.C. 20233.

3. *Composite estimate procedure.* In deriving the statistics for a given month, a composite estimating procedure is used to take account of net changes in the sample results from the previous month for the continuing 75 percent of the households in the sample. It is a weighted average of data from the current and previous months, and includes an additional term which is an estimate of the net difference between incoming and continuing parts of the current month's sample. Almost all estimates of month-to-month change are improved by this procedure. Most estimates of levels are also improved, but to a lesser extent.

Reliability of the estimates

Since the estimates in this report are based upon a sample of the population rather than a complete count, they may differ from the figures that would have been obtained if it had been possible to take a complete census using the same schedules and procedures as are used in the CPS. There are two types of errors in an estimate based on a sample survey—sampling and nonsampling. The sampling error tables in this report primarily indicate the magnitude of the sampling error. They also partially measure the effect of some nonsampling errors in response and enumeration, but do not measure any systematic biases in the data.

In general, the error of a sample estimate varies inversely with the size of the sample and directly with the size of the estimate. Hence, an estimate for a subgroup

[2] Prior to January 1985, there was no separate control for Hispanics in the second-stage ratio procedure. These controls are prepared by carrying forward the 1980 census count for Hispanics by adding estimated Hispanic births and immigrants and subtracting estimated Hispanic deaths and emigrants to yield an estimate of the Hispanic population by age and sex.

In addition, the second-stage ratio procedure was revised in January 1986 to reflect an explicit allowance for net undocumented immigration (mostly Hispanic) since April 1, 1980 (the census date) and an increase in the estimate of emigration of legal foreign-born residents, also since 1980. The nature and effect of these changes on the labor force estimates are discussed in detail in "Changes in the Estimation Procedure in the Current Population Survey Beginning in January 1986" in the February 1986 issue of *Employment and Earnings.*

constituting a small proportion of a population will tend to have a small absolute (and large relative) error than an estimate for a subgroup constituting a large proportion of that same population.

Reliability standards

Since the CPS is designed to produce both national and State estimates, the proportion of the total population sampled and, hence, the sampling ratios differ among the States. In general, the smaller the population of the State, the larger the sampling proportion. For example, in Alaska approximately 1 in every 200 households was sampled each month in 1985, whereas in California the sample covered about 1 in every 2,100 households. Nevertheless, the size of the sample in California is 4 times larger than in Alaska because California has a larger percentage of the national population.

Differences in the probability of selecting each household in each State are necessary to obtain total unemployment levels meeting a minimum level of reliability—a maximum expected annual coefficient of variation of 10 percent, at one standard error, given a 6 percent unemployment rate. Before CPS labor force data for a State or area can be used as the official estimates in the Federal-State cooperative program, the size of the sample for that area must be large enough to produce estimates meeting that minimum standard of reliability.

Publication standards for State and area CPS data

In order to achieve comparability of the data for regions, divisions, States, SMSA's, and cities for publication purposes, a unique requirement for minimum labor force, employment, and unemployment had to be developed for each area. This requirement is based on the known differences in sampling ratios among these areas. Before estimates are published for a specific category, a predetermined "critical cell" must meet the comparable minimum publication standard for national CPS data. As a result of this requirement, minimum bases for publication have been developed for each area. Table B-1 lists the mininum necessary base for publication of data in each of the regions, divisions, States, the District of Columbia, and the metropolitan areas and cities appearing in this bulletin.

Estimates are not shown when they do not meet the minimum base for the State or area listed in table B-1. In tables showing the labor force status of the population, the critical cell is the size of the labor force of the particular population group. In all other tables, the determining factor or critical cell is the size of the base of the distribution—i.e., the size of total employment or unemployment for that area or population subgroup. Data are not published for any cell with fewer than 500 persons or less than 0.5 percent.

Using the sampling error tables

The sampling error tables (tables B-2 through B-37) can be used directly to develop 90-percent confidence intervals for sample estimates. (A sampling error equals 1.645 times one standard error.) They indicate the order of magnitude of the sampling error rather than the precise amount of the possible error in an estimate.

Table B-14 shows that an estimate of 50,000 unemployed persons (total or white) in Alabama will have an absolute sampling error of 11,000, and a relative sampling error of 22 percent, while an estimate of 100,000 unemployed persons in Alabama has an absolute sampling error of 15,000 and a relative sampling error of 15 percent.

The statement that unemployment in Alabama is between 39,000 and 61,000 in the first instance, and between 85,000 and 115,000 in the second, is made with 90-percent confidence. If repeated samples were drawn from the same population and a confidence interval (based on the sample estimate plus and minus the sampling error) were constructed for each sample estimate, the true value based on a complete census of the population would be contained within 90 percent of these intervals. Hence, we can be 90-percent confident that the interval constructed does, in fact, contain the true value.

To calculate a 68-percent confidence interval (two chances out of three), multiply the sampling error shown by 0.6. To convert the sampling error to 95-percent confidence (19 chances out of 20), multiply the sampling error by 1.19. For the example given above, the sampling error at 90-percent confidence was 11,000. At 68-percent confidence, the error would be about 6,600 (11,000 X 0.6 = 6,600). At 95-percent confidence, the error would be about 13,100 (11,000 X 1.19 = 13,090).

To compute the error of a difference from the tables, an additional step is required. If, for instance, one wishes to know whether a change in the unemployment rate from 1984 to 1985 in a particular area is statistically significant, or whether the difference in the unemployment rate between two areas or population groups is statistically meaningful, the significance of the difference needs to be computed.

To test for the significance of a difference, the following formula should be used:

$$E_d = \sqrt{E_1^2 + E_2^2 - C}$$

where: E_1 = the sampling error of one group or year
E_2 = The sampling error of another group or year
C = the covariance (or relationship) term between E_1 and E_2
E_d = the sampling error of the difference

The E_1 and the E must be found in the appropriate

Geographic Profile for each year, since the size of the samples and, consequently, sampling errors may differ from year to year. Estimates for the "C" term for areas in this report are not available. (If the relationship between the two groups or years is small, the "C" term may be ignored. If, however, there is a strong positive relationship between the two groups, then the error computed without the "C" term will be overstated.) An example will show how this significance test is applied. Suppose one wished to know whether a hypothetical change in the CPS unemployment rate in Alaska from 10.0 percent in 1984 to 8.0 percent in 1985 is significant. Assume that the labor force was about 100,000 in both years. Table B-14 in the 1984 *Geographic Profile* gives the error for a 10.0-percent unemployment rate as 1.54, and table B-20 in this year's *Geographic Profile* gives the error for an 8.0-percent unemployment rate as 1.18. Using the formula described above, the following would result:

$$E_1 = 1.54 \qquad E_2 = 1.18$$

$$E_1^2 + E_2^2 = 3.764$$

$$\sqrt{3.764} = 1.94$$

Assuming a negligible "C" term, the error of the difference is about 1.9. Since the actual change (2.0 percent) exceeds the error of the difference, it can be stated, with 90-percent confidence, that the difference in rates is attributable to factors other than sampling error alone.

To derive a sampling error for a given estimate, it may be necessary to use interpolation or extrapolation. For example, table B-14 contains no sampling error for an estimate of 150,000 unemployed persons in Alabama. The following formula shows how to interpolate for an estimate of 150,000 in Alabama:

$$E_S = [[(S - G) / (F - G)] \times (X - Y)] + Y$$

where: F = published size immediately above the size desired (200,000)

G = published size immediately below the size desired (100,000)

S = size desired (150,000)

X = error of the F (21,000)

Y = error of G (15,000)

E_S = error of S (18,000)

If the sample estimate lies outside the boundaries of the error tables, extrapolation can be used to approximate the sampling error. The formula for extrapolation is the same as that for interpolation; however, the "F" term is the highest value in the table and the "G" term becomes the next highest value.

Derivation of sampling errors

These State and area sampling errors are developed using a generalized procedure and are not based on the sample data for each individual area. As with all sampling error tables produced for CPS State and area data, a number of approximations were required in order to derive sampling errors that would be applicable to a wide variety of items. As a result, these sampling errors provide an indication of the order of magnitude of a sampling error rather than a precise sampling error for any specific item. The sampling error tables are derived from standard error equations and special parameters developed by the Bureau of the Census. These may be obtained from BLS upon request.

Appendix C. Geographic Boundary Definitions

This appendix lists the States composing the Census divisions and regions. It also provides the geographic definitions of Standard Metropolitan Statistical Areas (SMSA's) and Labor Market Areas (LMA's). Revised area definitions will be introduced with the publication of 1986 annual data.

The Census regions and divisions and the States they comprise are:

Northeast
- New England
  - Maine
  - New Hampshire
  - Vermont
  - Massachusetts
  - Rhode Island
  - Connecticut
- Middle Atlantic
  - New York
  - New Jersey
  - Pennsylvania

Midwest
- East North Central
  - Ohio
  - Indiana
  - Illinois
  - Michigan
  - Wisconsin
- West North Central
  - Iowa
  - Missouri
  - Nebraska
  - Kansas
  - Minnesota
  - North Dakota
  - South Dakota

South
- South Atlantic
  - Delaware
  - Maryland
  - District of Columbia
  - Virginia
  - West Virginia
  - North Carolina
  - South Carolina
  - Georgia
  - Florida
- East South Central
  - Kentucky
  - Tennessee
  - Alabama
  - Mississippi
- West South Central
  - Arkansas
  - Louisiana
  - Oklahoma
  - Texas

West
- Mountain
  - Montana
  - Wyoming
  - Colorado
  - Utah
  - Idaho
  - Arizona
  - Nevada
  - New Mexico
- Pacific
  - California
  - Hawaii
  - Washington
  - Oregon
  - Alaska

The Department of Labor has used LMA's for a number of years for various administrative and programmatic purposes. The boundaries for almost all LMA's are the same as those for SMSA's, as established by the Office of Management and Budget. SMSA boundaries are defined using a specific set of criteria developed for that purpose. LMA's are determined by the State employment security agencies, using rules established by the Department of Labor. Since many LMA's were established before they were designated as an SMSA, there are a few areas where boundary differences reflect this initial classification discrepancy.

In general, an SMSA is defined as a county containing at least one city with 50,000 inhabitants or more, or several economically and socially related contiguous counties with at least one city of 25,000 inhabitants or more. In the New England States, where SMSA's are

composed of cities and towns, the minimum population size is 75,000.

The boundaries of SMSA's are occasionally revised. The table that follows compares the boundaries of 30 large SMSA's in 1970 and 1973 (the current SMSA boundaries) with the current LMA boundaries. With the exception of Minneapolis-St. Paul and New York, estimates in section III refer to SMSA's.

Table C-1. Geographic boundaries of metropolitan areas (SMSA's and LMA's)

Area	SMSA 1970 definition	SMSA 1973 definition	LMA definition[1]
Anaheim-Santa Ana-Garden Grove ..	Orange County	Same	Same
Atlanta	Counties of Cobb, Clayton, DeKalb, Fulton, Gwinnett	1970 definition plus counties of Butts, Cherokee, Douglas, Fayette, Forsyth, Henry, Newton, Paulding, Rockdale, Walton	1973 definition
Baltimore	City of Baltimore, Counties of Anne Arundel, Baltimore, Carroll, Harford, and Howard	Same	Same
Boston	Suffolk County and parts of Counties of Essex, Middlesex, Norfolk, Plymouth	1970 definition plus Boxford Town in Essex County; Towns of Acton, Boxborough, Carlisle, Holliston in Middlesex County; Bellingham, Foxborough, Franklin, Medway, Stoughton, Wrentham in Norfolk County; and Abington, Hanson, Kingston in Plymouth County.	1973 definition
Buffalo	Counties of Erie, Niagara	Same	Same
Chicago	Counties of Cook, Du Page, Kane, Lake, McHenry, Will	Same	Same
Cincinnati	Ohio portion: Counties of Clermont, Hamilton, Warren Kentucky portion: Counties of Boone, Campbell, Kenton Indiana portion: Dearborn County	Same	Same
Cleveland	Counties of Cuyahoga, Geauga, Lake, Medina	Same	Same
Dallas-Fort Worth	Counties of Collin, Dallas, Denton, Ellis, Kaufman, Rockwall, Johnson, Tarrant	1970 definition plus Counties of Hood, Parker, and Wise	Same
Denver-Boulder	Counties of Adams, Arapahoe, Boulder, Jefferson, Denver	1970 definition plus Counties of Douglas, Gilpin	1973 definition plus Clear Creek County
Detroit	Counties of Macomb, Oakland, Wayne	1970 definition plus Counties of Lapeer, Livingston, St. Clair	1973 definition
Houston	Counties of Brazoria, Fort Bend, Harris, Liberty, Montgomery	1970 definition plus Waller County	1973 definition
Indianapolis	Counties of Boone, Hamilton, Hancock, Hendricks, Johnson, Marion, Morgan, Shelby	Same	Same
Kansas City	Missouri portion: Counties of Cass, Clay, Jackson, Platte Kansas portion: Counties of Johnson, Wyandotte	1970 definition plus Ray County, Mo.	1973 definition
Los Angeles-Long Beach	Los Angeles County	Same	Same
Miami	Dade County	Same	Same
Milwaukee	Counties of Milwaukee, Ozaukee, Washington, Waukesha	Same	Same
Minneapolis-St. Paul	Minnesota portion: Counties of Anoka, Dakota, Hennepin, Ramsey, Washington	1970 definition plus Counties of Carver, Chisago, Scott, Wright, Minn., and St. Croix, Wis.	1973 definition minus St. Croix County
Nassau-Suffolk	Counties of Nassau, Suffolk	Same	Same

See footnotes at end of table.

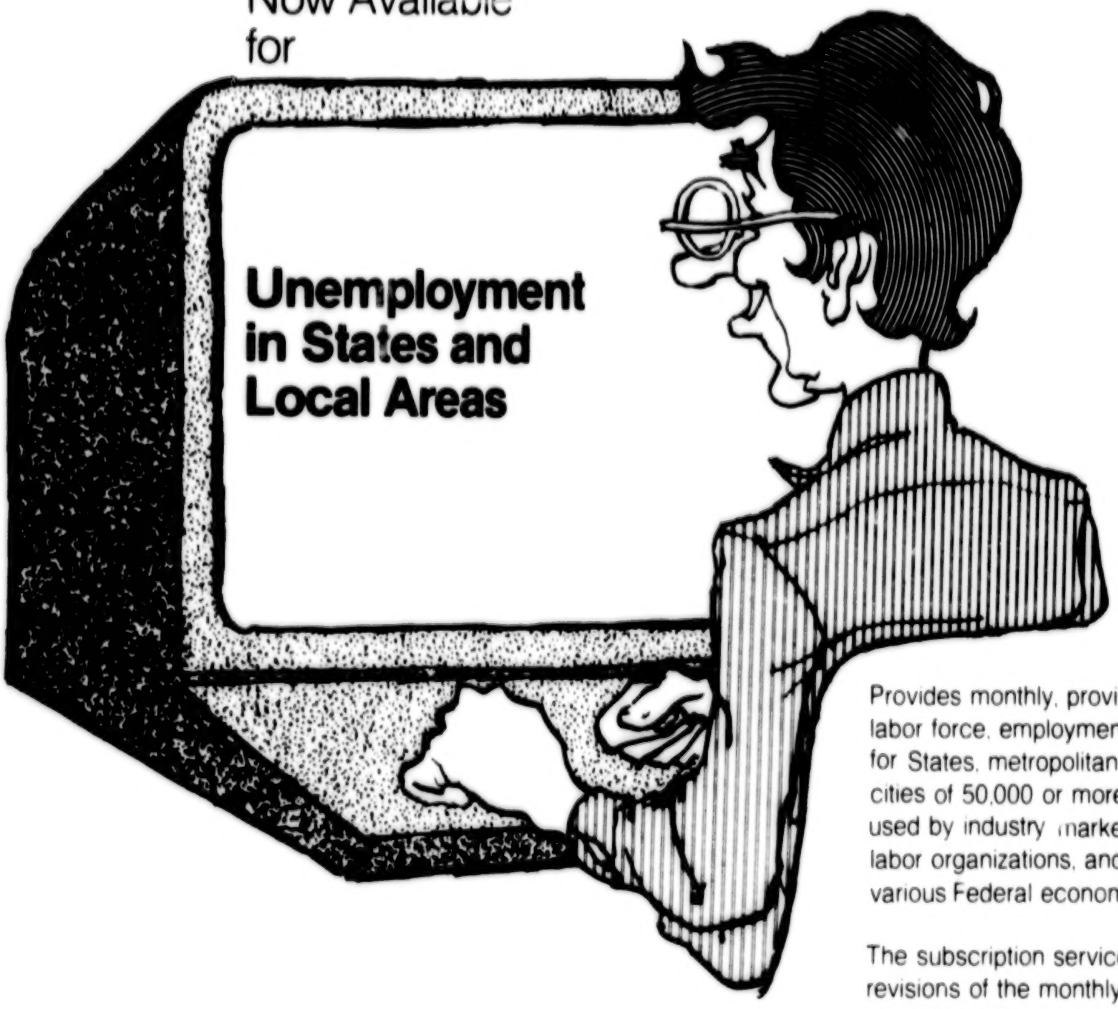

Table C-1. Continued—Geographic boundaries of metropolitan areas (SMSA's and LMA's)

Area	SMSA 1970 definition	SMSA 1973 definition	LMA definition[1]
New York	New York portion: New York City (5 Counties), and Counties of Rockland, Westchester	1970 definition plus Putnam County, N.Y., and Bergen County, N.J.	1973 definition minus Bergen County
Newark	Counties of Essex, Morris, Union	1970 definition plus Somerset County	1973 definition
Philadelphia	Pennsylvania portion: Counties of Bucks, Chester, Delaware, Montgomery, Philadelphia New Jersey portion: Counties of Burlington, Camden, Gloucester	Same	Same
Pittsburgh	Counties of Allegheny, Beaver, Washington, Westmoreland	Same	Same
Riverside-San Bernardino-Ontario	Counties of Riverside, San Bernardino	Same	Same
St. Louis	Missouri portion: St. Louis City and Counties of Franklin, Jefferson, St. Charles, St. Louis Illinois portion: Counties of Madison, St. Clair	1970 definition plus Counties of Clinton, Monroe, Ill.	1973 definition
San Francisco-Oakland	Counties of Alameda, Contra Costa, Marin, San Francisco, San Mateo	Same	Same
San Jose	Santa Clara County	Same	Same
San Diego	San Diego County	Same	Same
Seattle-Everett	Counties of King, Snohomish	Same	Same
Washington, D.C.	District of Columbia Virginia portion: Counties of Arlington, Fairfax, Loudoun, Prince William, Cities of Alexandria, Falls Church, Fairfax, Manassas, Manassas Park Maryland portion: Counties of Montgomery, Prince Georges	1970 definition plus Charles County, Md.	1973 definition

[1] Except for Denver-Boulder, for which the estimates are based on the 1973 SMSA geographic boundaries, all metropolitan area estimates are based on the LMA boundaries.

BLS Data Diskettes now available

BLS data users now can store and manipulate the Bureau's data series on their personal, IBM-compatible microcomputers

The following data diskettes are formatted for use with LOTUS 1-2-3:

Monthly

Employment, hours, and earnings from the establishment survey—national monthly and annual average data for 256 industrial series for the current year-to-date and the 3 prior years. Single diskette, $35. Annual subscription of 12 monthly diskettes, $288.

Labor force, employment, and unemployment from the Current Population Survey—monthly and annual average information on the employment and unemployment experience of the Nation's population classified by age, sex, and race for 282 series for the current year-to-date and the 3 prior years. Single diskette, $35. Annual subscription of 12 monthly diskettes, $288.

Producer Price Indexes—selected commodity groupings by stage of processing for the most recent 13 months. Single diskette, $35. Annual subscription of 12 monthly diskettes, $288.

Quarterly

Employment Cost Index—quarterly measures of change in total compensation (wages, salaries, and employer costs for employee benefits) and in wages and salaries only; 180 series beginning in 1980–81 and 120 series from 1975 to the most recent quarter. Single diskette, $35. Annual subscription of 4 quarterly diskettes, $104.

National productivity indexes—63 quarterly labor productivity and cost measures for business, nonfarm business, nonfinancial corporations, and manufacturing from 1947 to the current quarter. Also, 24 annual multifactor productivity measures (output per unit of combined labor and capital inputs) for private business, private nonfarm business, and manufacturing from 1948 to the current year. Single diskette, $35. Annual subscription of 8 quarterly diskettes, $196.

U.S. export and import price indexes—quarterly export and import price indexes for 450 Standard Industrial Trade Classification categories for the most recent 8 quarters. Single diskette, $35. Annual subscription of 4 quarterly diskettes, $104.

Annual

Economic projections to 1995—average annual output, total employment, hours, and wage and salary employment for 1984 and projected 1985–95 for 150 industries. Single diskette, $35.

Foreign labor statistics—129 annual indexes of manufacturing productivity and labor costs for the United States and 11 foreign countries from 1950 to 1984, and levels of the labor force, unemployment, and related measures for the United States and 9 countries from 1959 to 1984. Single diskette, $35. Annual subscription of 4 quarterly diskettes, $104.

Industry productivity data—annual indexes showing change over time in the relationship between the output of an industry and the employee hours expended on the output for over 130 industries; most start in 1963 and go to the most recent year. Also, annual Federal Government productivity indexes showing the change over time in the relationship between the output of the combined organizations within a function and the employee years expended on that output from 1967 to 1983. Single diskette, $35.

Occupational injury and illness data—annual number of work-related injuries and illnesses or lost workdays per 100 full-time employees from 1981 to 1984. Single diskette, $35.

unemployment

Preface

Data on labor force, employment, and unemployment in State and sub-State areas are available from two major sources—the Current Population Survey (CPS) and the Federal-State Cooperative Program. This bulletin presents data from the CPS for regions, States, and selected large metropolitan areas and central cities. It provides 1986 annual averages for the employed and the unemployed by selected demographic and economic characteristics based on population counts projected from the 1980 decennial census.

Comparable data for 1980-85 were published in *Geographic Profile of Employment and Unemployment* as follows: 1985, Bulletin 2266; 1984, Bulletin 2234; 1983, Bulletin 2216; 1982, Bulletin 2170; and 1981 and 1980, Bulletin 2156. Bulletin 2156 also provided instructions for adjusting 1970 census-based data for earlier years to reflect 1980 census population counts.

Beginning with 1986 annual data, this bulletin introduces revised definitions for metropolitan areas based on guidelines and standards established by the U.S. Office of Management and Budget in 1983. (See appendix C.)

The official Bureau of Labor Statistics estimates for States, metropolitan areas, and central cities, which are the basis for determining the eligibility of an area for benefits under Federal economic assistance programs, result from the Federal-State Cooperative Program. BLS is responsible for establishing the estimating procedures; the State employment security agencies are responsible for developing the estimates. For all States, the District of Columbia, the Los Angeles Metropolitan Statistical Area, and New York City, the official annual average estimates are obtained directly from the CPS. For the remaining metropolitan areas and cities, the official annual average estimates are derived using a standardized procedure. Data from the CPS for metropolitan areas and cities in this bulletin are not the official BLS estimates and are provided because they are the only current source of information on demographic and economic characteristics.

This bulletin was prepared by the Data Users' and Publication Services Group and the Data Services Group in collaboration with the Division of Local Area Unemployment Statistics.

Material in this publication is in the public domain and, with appropriate credit, may be reproduced without permission.

C. Geographic boundary definitions 196

Geographic Profile of Employment and Unemployment, 1986

The Current Population Survey (CPS) is the regular monthly survey of about 59,500 households from which the national unemployment rate is derived. (See appendix A for concepts and definitions used in the CPS, and appendix B for a description of the estimation procedure.)

Annual average estimates of the labor force by demographic characteristics (age, sex, race, and Hispanic origin) and the economic characteristics of the employed and unemployed are published in this bulletin only if they meet the BLS standards of reliability for publication. (See appendix B for an explanation of the BLS standards for publication of CPS data.) Estimates for census regions and divisions are shown in section I; States are shown in section II; and metropolitan areas and cities are shown in section III.

Since these estimates are based on a survey rather than on a complete census of the population, they are subject to sampling error. Consequently, error ranges have been provided, at a 90-percent confidence interval, for the unemployment rates in the first table of sections I, II, and III. In addition, appendix B provides tables from which the sampling error ranges can be obtained for the data in other tables in these sections.

Section I. Estimates for Census Regions and Divisions

Table 1. Census regions and divisions: Employment status of the civilian noninstitutional population by sex, age, race, Hispanic origin, and marital status, 1986 annual averages—Continued

(Numbers in thousands)

Area and population group	Civilian noninstitutional population	Civilian labor force		Employment		Unemployment		
		Number	Percent of population	Number	Percent of population	Number	Rate	Error range of rate[1]
Middle Atlantic Division

Other marital status[3]	4,794	2,731	57.0	2,511	52.4	220	8.0	7.4	- 8.7

[1] Error ranges are calculated at the 90-percent confidence interval, which means that if repeated samples were drawn from the same population and an error range constructed around each sample estimate, in 9 out of 10 cases the true value based on a complete census of the population would be contained within these error ranges.

[2] Because of separate processing and weighting procedures, totals for the United States differ from the results obtained by aggregating the totals for regions and States.

[3] "Other marital status" includes divorced, widowed, separated, and married with spouse absent.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

[1] Employed persons with a job but not at work are distributed according to whether they usually work full- or part-time.

[2] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in that area. See appendix B.

NOTE: Items may not add to totals because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Table 3. Census regions and divisions: Employment status of the experienced[1] civilian labor force by occupation, 1986 annual averages

(Numbers in thousands)

Farm operators and managers	1.1	[2]	1.1	.4	.2	.4	.7	.6	.8	.7	1.3	1.6	1.0

[1] Excludes persons with no previous work experience.

[2] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in that area. See appendix B.

[3] Less than 500 persons or less than 0.05 percent.

NOTE: Items may not add to totals or compute to displayed rates because of rounding.

[1] Less than 500 persons employed or less than 0.05 percent of total employed.

[2] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in that area. See appendix B.

NOTE: Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

[1] Includes toys, amusement, and sporting goods.

[2] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in that area. See appendix B.

[3] Less than 500 persons employed or less than 0.05 percent of total employed.

NOTE: Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Table 7. Census regions and divisions: Civilians at work by sex, age, race, Hispanic origin, and hours of work, 1986 annual averages

(Numbers in thousands)

Population group and area	Total at work	Hours of work								Average hours	
		1-14 hours	15-29 hours	30-34 hours	35 hours and over	35-39 hours	40 hours	41-48 hours	49 hours and over	Total	Full-time schedules[1]

[1] Refers to persons who worked 35 hours or more during the survey week.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Table 8. Census regions and divisions: Civilians at work 1 to 34 hours by sex, race, reason for working less than 35 hours, and usual status, 1986 annual averages

(In thousands)

Other marital status[2]	56	34	60.4	31	54.6	3	9.6	7.2 - 12.1

[1] Error ranges are calculated at the 90-percent confidence interval, which means that if repeated samples were drawn from the same population and an error range constructed around each sample estimate, in 9 out of 10 cases the true value based on a complete census of the population would be contained within these error ranges.

[2] "Other marital status" includes divorced, widowed, separated, and married with spouse absent.

[3] Less than 500 persons or less than 0.05 percent.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

[1] Employed persons with a job but not at work are distributed according to whether they usually work full- or part-time.

[2] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in that area. See appendix B.

NOTE: Items may not add to totals because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Table 14. States: Employment status of the experienced[1] civilian labor force by occupation, 1986 annual averages

(Numbers in thousands)

Employment status and State	Total	Managerial and professional specialty		Technical, sales, and administrative support			Service occupations	Precision production, craft, and repair	Operators, fabricators, and laborers			Farming, forestry, and fishing
		Executive, administrative, and managerial	Professional specialty	Technicians and related support	Sales	Administrative support, including clerical			Machine operators, assemblers, and inspectors	Transportation and material moving	Handlers, equipment cleaners, helpers, and laborers

Table 14. States: Employment status of the experienced[1] civilian labor force by occupation, 1986 annual averages—Continued

(Numbers in thousands)

Employment status and State	Total	Managerial and professional specialty		Technical, sales, and administrative support			Service occupations	Precision production, craft, and repair	Operators, fabricators, and laborers			Farming, forestry, and fishing
		Executive, administrative, and managerial	Professional specialty	Technicians and related support	Sales	Administrative support, including clerical			Machine operators, assemblers, and inspectors	Transportation and material moving	Handlers, equipment cleaners, helpers, and laborers	
UNEMPLOYMENT RATE—Continued												
South Dakota	4.3	1.9	1.5	3.0	3.2	3.9	6.2	5.4	5.5	8.8	15.0	2.2
Tennessee	7.0	3.5	1.5	3.3	5.7	4.5	10.7	7.8	10.1	6.0	13.8	7.1
Texas	8.0	3.8	2.6	4.4	7.4	6.0	10.5	10.5	13.9	10.7	16.8	10.5
Utah	5.6	3.9	.7	4.2	5.5	4.9	8.7	7.3	8.4	9.2	6.9	3.5
Vermont	4.3	2.4	1.5	.7	3.5	3.4	6.9	5.7	7.2	4.6	8.9	2.9
Virginia	4.3	1.5	1.7	1.9	4.9	2.5	7.6	4.4	6.4	7.5	10.5	2.5
Washington	7.4	4.5	2.3	[2]	4.7	7.2	12.1	7.5	14.4	9.7	13.7	10.8
West Virginia	10.7	5.0	1.9	[2]	7.1	4.0	11.2	16.1	18.6	15.1	19.7	[2]
Wisconsin	6.2	2.5	2.3	2.8	3.9	4.3	6.9	7.7	10.7	8.7	16.0	5.9
Wyoming	8.2	4.0	3.8	[2]	8.9	5.6	8.7	9.7	11.5	11.0	22.6	5.8

[1] Excludes persons with no previous work experience.

[2] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in that area. See appendix B.

[3] Less than 500 persons or less than 0.05 percent.

NOTE: Items may not add to totals or compute to displayed rates because of rounding.

[1] Less than 500 persons employed or less than 0.05 percent of total employed.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Table 16. States: Employment status of the experienced[1] civilian labor force by industry, 1986 annual averages

[1] Excludes persons with no previous work experience.

[2] Includes private household workers, self-employed and unpaid family workers, and mining.

[3] Includes self-employed and unpaid family workers and mining.

[4] Includes mining.

[5] Excludes private household workers.

[6] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in that area. See appendix B.

[7] Less than 500 persons or less than 0.05 percent.

NOTE: Items may not add to totals or compute to displayed rates because of rounding.

Table 17. States: Percent distribution of employed civilians by sex, race, Hispanic origin, and industry, 1986 annual averages

[1] Includes private household workers, self-employed and unpaid family workers, and mining.

[2] Includes self-employed and unpaid family workers and mining.

[3] Includes mining.

[4] Excludes private household workers.

[5] Less than 500 persons employed or less than 0.05 percent of total employed.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Table 18. States: Civilians at work by sex, age, race, Hispanic origin, and hours of work, 1986 annual averages

(Numbers in thousands)

Utah	32	2	3	4	22	2	14	3	3	36.7	42.3
Wyoming	8	(2)	1	1	6	(2)	4	(2)	1	36.4	42.1

[1] Refers to persons who worked 35 hours or more during the survey week.

[2] Less than 500 persons or less than 0.05 percent.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Table 19. States: Civilians at work 1 to 34 hours by sex, race, reason for working less than 35 hours, and usual status, 1986 annual averages

(In thousands)

Texas	219	100.0	52.3	8.6	11.3	23.0	13.4

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Table 22. States: Percent distribution of unemployed persons by sex, age, race, Hispanic origin, and duration of unemployment, 1986 annual averages

New Jersey	27	100.0	42.5	27.6	29.9	13.9
New Mexico	30	100.0	40.7	33.0	26.2	14.2
New York	86	100.0	38.2	31.3	30.5	18.3
Texas	219	100.0	50.2	29.8	20.1	10.0

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Section III. Estimates for Metropolitan Areas and Cities

Table 23. Selected metropolitan areas and cities: Employment status of the civilian noninstitutional population by sex, age, race, Hispanic origin, and marital status, 1986 annual averages

(Numbers in thousands)

Area and population group	Civilian non-institutional population	Civilian labor force		Employment		Unemployment		
		Number	Percent of population	Number	Percent of population	Number	Rate	Error range of rate[1]

[1] Error ranges are calculated at the 90-percent confidence interval, which means that if repeated samples were drawn from the same population and an error range constructed around each sample estimate, in 9 out of 10 cases the true value based on a complete census of the population would be contained within these error ranges.

[2] "Other marital status" includes divorced, widowed, separated, and married with spouse absent.

[3] Less than 500 persons or less than 0.05 percent.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Table 24. Selected metropolitan areas and cities: Employment status of the experienced[1] civilian labor force by occupation, 1986 annual averages

(Numbers in thousands)

Employment status and area	Total	Managerial and professional specialty		Technical, sales, and administrative support			Service occupations	Precision production, craft, and repair	Operators, fabricators, and laborers		
		Executive, administrative, and managerial	Professional specialty	Technicians and related support	Sales	Administrative support, including clerical			Machine operators, assemblers, and inspectors	Transportation and material moving	Handlers, equipment cleaners, helpers, and laborers

[1] Excludes persons with no previous work experience.

[2] All are Metropolitan Statistical Areas (MSA's) except those labeled Consolidated Metropolitan Statistical Areas (CMSA's) or Primary Metropolitan Statistical Areas (PMSA's). The differences are discussed in appendix C, "Geographic Boundary Definitions".

[3] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in that area. See appendix B.

[4] Less than 500 persons or less than 0.05 percent.

NOTE: Items may not add to totals or compute to displayed rates because of rounding.

Table 25. Selected metropolitan areas and cities: Percent distribution of employed civilians by sex, race, Hispanic origin, and occupation, 1986 annual averages

Population group and area	Total employed		Managerial and professional specialty		Technical, sales, and administrative support			Service occupations	Precision production, craft, and repair	Operators, fabricators, and laborers		
	Number (in thousands)	Percent	Executive, administrative, and managerial	Professional specialty	Technicians and related support	Sales	Administrative support, including clerical			Machine operators, assemblers, and inspectors	Transportation and material moving	Handlers, equipment cleaners, helpers, and laborers

[1] All are Metropolitan Statistical Areas (MSA's) except those labeled Consolidated Metropolitan Statistical Areas (CMSA's) or Primary Metropolitan Statistical Areas (PMSA's). The differences are discussed in appendix C, "Geographic Boundary Definitions".

[2] Less than 500 persons employed or less than 0.05 percent of total employed.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

[1] Excludes persons with no previous work experience.
[2] Includes self-employed and unpaid family workers and mining.
[3] Includes mining.
[4] Excludes private household workers.
[5] All are Metropolitan Statistical Areas (MSA's) except those labeled Consolidated Metropolitan Statistical Areas (CMSA's) or Primary Metropolitan Statistical Areas (PMSA's). The differences are discussed in appendix C, "Geographic Boundary Definitions".
[6] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in that area. See appendix B.
[7] Less than 500 persons or less than 0.05 percent.

NOTE: Items may not add to totals or compute to displayed rates because of rounding.

Table 27. Selected metropolitan areas and cities: Percent distribution of employed civilians in nonagricultural industries by sex, race, and Hispanic origin, 1986 annual averages

Population group and area	Total employed[1]		Private nonagricultural wage and salary workers									Government
					Manufacturing			Transportation, communications, and public utilities	Trade	Finance, insurance, and real estate	Services[3]	
	Number (in thousands)	Percent	Total[2]	Construction	Total	Durable goods	Nondurable goods

[1] Includes self-employed and unpaid family workers and mining.
[2] Includes mining.
[3] Excludes private household workers.
[4] All are Metropolitan Statistical Areas (MSA's) except those labeled Consolidated Metropolitan Statistical Areas (CMSA's) or Primary Metropolitan Statistical Areas (PMSA's). The differences are discussed in appendix C, "Geographic Boundary Definitions".
[5] Less than 500 persons employed or less than 0.05 percent of total employed.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Appendix A. Concepts and Definitions of Data Derived from the Current Population Survey

Tables showing labor force status include provisional estimates of the civilian noninstitutional population 16 years and over as well as data on the civilian labor force, unemployment rates, and labor force participation rates. Population estimates are revised by the Bureau of the Census each year, and the revised estimates are incorporated into the CPS labor force levels. This adjustment affects the estimates of labor force, employment, and unemployment but does not affect percentages such as unemployment rates, participation rates, or employment-population ratios.

The *civilian labor force* comprises all civilians classified as employed or unemployed in accordance with the criteria described below.

The *employed* are all civilians who did any work as paid employees or in their own business during the survey week, or who worked 15 hours or more as unpaid workers in an enterprise operated by a family member. Persons temporarily absent from a job because of illness, bad weather, a strike, or for personal reasons are also counted as employed whether they were paid by their employer or were seeking other jobs.

The *unemployed* are all civilians who did not work during the survey week, made specific efforts to find a job in the prior 4 weeks, and were available for work during the survey week (except for temporary illness). Persons waiting to be recalled to a job from which they had been laid off, or waiting to report to a new job within 30 days, need not be looking for work to be classified as unemployed.

Duration of unemployment represents the length of time (through the current survey week) during which persons classified as unemployed have been continuously looking for work. For persons on layoff, duration of unemployment represents the number of full weeks since the termination of their most recent employment. A period of 2 weeks or more during which a person was employed or ceased looking for work is considered to break the continuity of the present period of jobseeking. Duration of unemployment measures the length of a spell of unemployment currently in progress. Hence, it should not be confused with a completed spell of unemployment.

Reasons for unemployment are divided into four major groups: (1) *Job losers* are persons whose employment ended involuntarily and who immediately began looking for work, and persons on layoff. (2) *Job leavers* are persons who quit or otherwise terminated their employment voluntarily and immediately began looking for work. (3) *Reentrants* are persons who previously worked at a full-time job lasting 2 weeks or longer but were out of the labor force before looking for work. (4) *New entrants* are persons who never worked at a full-time job lasting 2 weeks or longer.

The unemployment rate for all civilian workers represents the number unemployed as a percent of the civilian labor force.

The civilian labor force participation rate is the ratio of the civilian labor force to the civilian noninstitutional population.

The civilian employment-population ratio is the percentage of all employed civilians in the civilian noninstitutional population.

Hours of work statistics relate to the actual number of hours worked during the survey week. For example, persons who normally work 40 hours a week, but who were off on the Columbus Day holiday, would be reported as working 32 hours even though they were paid for the holiday. For persons working in more than one job, the figures relate to the number of hours worked in all jobs during the survey week, with all hours credited to the major job.

Persons who worked 35 hours or more in the survey week are designated as working *full time;* correspondingly, persons who worked between 1 and 34 hours are designated as working *part time.* Part-time workers are classified by their usual status at their present job (either full or part time) and by their reason for working part time during the survey week (economic or noneconomic). "Economic reasons" include: Slack work, material shortages, repairs to plant or equipment, start or termination of job during the week, and inability to find full-time work. Noneconomic reasons include: Labor dispute, bad weather, own illness, vacation, demands of home, school, no desire for full-time work, and full-time worker only during the peak season. Persons on full-time schedules include, in addition to those working 35 hours or more, those who worked from 1 to 34 hours for noneconomic reasons and usually work full time.

The distribution of employment by hours worked relates to persons "at work" during the survey week. At-work data differ from data on total employment because the latter include persons in the zero-hours-worked category, "with a

job but not at work." Included in this latter group are persons who were on vacation, ill, involved in a labor dispute, or otherwise absent from their jobs for voluntary, noneconomic reasons. These persons are classified according to whether they usually work full or part time.

Occupational and industry data for the employed refer to the job held during the survey week. Persons with two jobs or more are classified according to the job in which they worked the most hours during the survey week. The unemployed are classified according to the last full-time civilian job held for 2 weeks or more. Beginning with 1983 data, all occupational and industry data presented in this bulletin are coded according to the classification systems used in the 1980 census, rather than the 1970 census systems used through 1982. While this conversion had little effect on industry-related data, the new occupational categories are so radically different that their implementation represents a break in historical data series. Additional information on the 1980 census occupational and industrial classification systems appears in "Revisions in the Current Population Survey Beginning in January 1983" in the February 1983 issue of *Employment and Earnings*.

Race and Hispanic origin. Beginning with 1981 annual averages, *Geographic Profile* presents racial data for white and black workers. Before 1981, racial data were published for white and "black and other" workers. The "other" category consists primarily of American Indians, Alaskan Natives, and Asians and Pacific Islanders.

Hispanic origin refers to persons who identified themselves in the enumeration process as Mexican, Puerto Rican, Cuban, Central South American, or of other Hispanic origin or descent. Persons of Hispanic origin may be of any race; thus, they are included in both the white and black population groups.

A more detailed description of the concepts and definitions used in this survey appears in *Concepts and Methods Used in Labor Force Statistics Derived from the Current Population Survey* (BLS Report 463) and the Explanatory Notes of the BLS monthly publication *Employment and Earnings*.

Appendix B. Sampling and Estimation Procedures and Sampling Error Tables

The estimates presented in this bulletin are based on annual averages of monthly data obtained from the CPS—a sample survey of the civilian noninstitutional population. The survey is conducted each month by the Bureau of the Census for BLS, and provides comprehensive data on the labor force, the employed, and the unemployed, including such characteristics as age, sex, race, Hispanic origin, marital status, occupation, and industry. The survey also provides data on the characteristics of those not in the labor force. The information is collected by trained interviewers from a scientifically selected sample designed to represent the civilian noninstitutional population. Each month, about 59,500 occupied housing units are eligible for interview. Respondents are interviewed using a standardized questionnaire to obtain information about the employment status of each household member 16 years of age and over. The reference period is the calendar week, Sunday through Saturday, which includes the 12th of the month. This is known as the survey week. Actual field interviewing is conducted during the week which includes the 19th of the month.

Inmates of institutions, members of the Armed Forces, and persons under 14 years of age are not covered in the regular monthly enumerations; data on members of the Armed Forces and persons under 16 are excluded from the population and labor force statistics shown in this bulletin.

Sampling procedures

The 1986 sample encompasses 729 sample areas comprising over 1,000 counties and cities, with coverage in every State and the District of Columbia. It is based to a large extent on information about the distribution of the population as reported in the 1980 decennial census. These areas were selected by dividing the entire area of the United States into 1,973 primary sampling units (PSU's). With some minor exceptions, a PSU consists of a county or number of contiguous counties. Most metropolitan areas constitute separate PSU's.

To improve the efficiency of the sample, the 1,973 PSU's were grouped into strata within each State. Then, one PSU was selected from each stratum, with the probability of selection proportionate to the population size in the PSU. PSU's in strata by themselves are self-representing, and generally are the most populated PSU's in each State. Other strata were formed by combining PSU's which were similar in such characteristics as population growth, proportion of blacks and Hispanics, occupation/industry, and age/sex distribution. PSU's selected from these strata are non-self-representing, since each one chosen represents the entire stratum.

Within each of the selected PSU's, the number of households to be enumerated each month is determined in two steps. First, a sample of census enumeration districts (ED's) is selected using the population size probability selection procedures. ED's are administrative units and contain, on the average, about 300 households. Second, clusters of approximately four addresses (contiguous, wherever possible) are selected to be enumerated within each designated ED.

Part of the sample is changed, or rotated, each month. A primary reason for rotating the sample is to minimize the lack of cooperation which may result from interviewing a constant panel indefinitely. Another reason for replacing households is to reduce the cumulative effect of response biases which are sometimes observed when the same persons are interviewed indefinitely. The rotation plan provides for three-fourths of the sample to be identical from one month to the next and one-half to be identical with the same month a year earlier.

Estimating methods

Under the estimating methods used, all of the results for a given month become available simultaneously and are based on returns from the entire panel of respondents. The estimation procedure involves the weighting up, or inflating, of the data from each sample person to develop estimates for the entire population from which the sample was drawn.

The basic weights, which are the inverse of the sampling ratios (defined as the number of sample households divided by total households in the State), are adjusted to better reflect the entire population, as described below.

1. *Noninterview adjustment.* The weights for all interviewed households are inflated to account for occupied sampled households for which no information was obtained because of impassable roads, refusals, unavailability of the respondent, or other reasons. The

proportion of sample households not interviewed for these reasons generally varies from 4 to 5 percent.

2. *Ratio estimates.* The distribution of the population as estimated by the sample may differ somewhat each month, by chance, from that of the population as a whole in such characteristics as age, sex, ethnic origin, and residence. Since these characteristics are closely correlated with labor force participation and other principal measurements made from the sample, the latter estimates can be substantially improved when adjusted appropriately to conform to the known distribution of these population characteristics. This is accomplished through two stages of ratio estimation as follows:

a. *First-stage ratio estimate.* As explained above, non-self-representing PSU's are chosen to represent not only themselves, but also other unsampled areas. The first-stage ratio adjustment procedure is designed to correct for the differences that existed at the time of the 1980 census between the distribution of the population by race in the non-self-representing sample areas and the corresponding distribution in the entire geographic area from which the non-self-representing areas were selected. The adjustment is made at the State level for each of the 43 States which contain non-self-representing areas by the race categories of black and non-black. The first-stage adjustment factors are derived using the non-self-representing PUS's in the sample, and hence, are recomputed only when a new PSU is rotated into the sample.

b. *Second-stage ratio estimate.* This stage is designed to adjust the inflated first-stage estimates to conform to the most recent distribution of the entire U.S. population by age-sex-race-Hispanic origin and is conducted in three steps.

In the first step, the sample population and labor force estimates are adjusted within each State and the District of Columbia using an independent control for the population 16 years and over for that area. In effect, the ratio of the independent and sample populations is used to inflate the sample labor force estimates. The second step involves an adjustment by Hispanic origin to a national estimate for eight age-sex categories by Hispanic and non-Hispanic origin.[1] In the third step, a national adjustment is made by the race categories of white, black, and other races to independent estimates by age and sex. The white and black categories contain 32 age-sex groups each while the other races category has 6 age-sex cells.

The entire second-stage ratio estimation procedure is iterated six times and, when completed, insures that the adjusted sample population estimates, both for the States and the national age-sex-race-Hispanic origin categories, will be virtually equal to the independent population estimates for these categories.

The monthly independent State controls for the civilian noninstitutional population 16 years and over are based on an arithmetic extrapolation of the trend in population growth from the April 1, 1980, census through the July 1 provisional estimate for the current year, with all State estimates prorated to a current estimate of the U.S. population. A description of the methodology used to derive the independent national age-sex-race-Hispanic origin estimates and State totals may be obtained from the Chief of the Population Division, U.S. Bureau of the Census, Washington, DC. 20233.

3. *Composite estimate procedure.* In deriving the statistics for a given month, a composite estimating procedure is used to take account of net changes in the sample results from the previous month for the continuing 75 percent of the households in the sample. It is a weighted average of data from the current and previous months, and includes an additional term which is an estimate of the net difference between incoming and continuing parts of the current month's sample. Almost all estimates of month-to-month change are improved by this procedure. Most estimates of levels are also improved, but to a lesser extent.

Reliability of the estimates

Since the estimates in this report are based upon a sample of the population rather than a complete count, they may differ from the figures that would have been obtained if it had been possible to take a complete census using the same schedules and procedures as are used in the CPS. There are two types of errors in an estimate based on a sample survey—sampling and nonsampling. The sampling error tables in this report primarily indicate the magnitude of the sampling error. They also partially measure the effect of some nonsampling errors in response and enumeration, but do not measure any systematic biases in the data.

In general, the error of a sample estimate varies inversely with the size of the sample and directly with the size of the estimate. Hence, an estimate for a subgroup constituting a small proportion of a population will tend to have a smaller absolute (and larger relative) error than an estimate for a subgroup constituting a large proportion of that same population.

[1] Prior to January 1985, there was no separate control for Hispanics in the second-stage ratio estimation procedure. These controls are prepared by carrying forward the 1980 census count for Hispanics by adding estimated Hispanic births and immigrants and subtracting estimated Hispanic deaths and emigrants to yield an estimate of the Hispanic population by age and sex.

In addition, the second-stage ratio estimation procedure was revised in January 1986 to reflect an explicit allowance for net undocumented immigration (mostly Hispanic) since April 1, 1980 (the census date) and an increase in the estimate of emigration of legal foreign-born residents, also since 1980. The nature and effect of these changes on the labor force estimates are discussed in detail in "Changes in the Estimation Procedure in the Current Population Survey Beginning in January 1986" in the February 1986 issue of *Employment and Earnings.*

Reliability standards

Since the CPS is designed to produce both national and State estimates, the proportion of the total population sampled and, hence, the sampling ratios differ among the States. In general, the smaller the population of the State, the larger the sampling proportion. For example, in Alaska approximately 1 in every 200 households was sampled each month in 1986, whereas in California the sample covered about 1 in every 2,200 households. Nevertheless, the size of the sample in California is 4 times larger than in Alaska because California has a larger percentage of the national population.

Differences in the probability of selecting each household in each State are necessary to obtain total unemployment levels meeting a minimum level of reliability—a maximum expected annual coefficient of variation of 10 percent, at one standard error, given a 6-percent unemployment rate. Before CPS labor force data for a State or area can be used as the official estimates in the Federal-State Cooperative Program, the size of the sample for that area must be large enough to produce estimates meeting that minimum standard of reliability.

Publication standards for State and area CPS data

In order to achieve comparability of the data for regions, divisions, States, metropolitan areas, and cities for publication purposes, a unique requirement for minimum labor force, employment, and unemployment had to be developed for each area. This requirement is based on the known differences in sampling ratios among these areas. Before estimates are published for a specific category, a predetermined "critical cell" must meet the comparable minimum publication standard for national CPS data. As a result of this requirement, minimum bases for publication have been developed for each area. Table B-1 lists the minimum necessary base for publication of data in each of the regions, divisions, States, the District of Columbia, and the metropolitan areas and cities appearing in this bulletin.

Estimates are not shown when they do not meet the minimum base for the State or area listed in table B-1. In tables showing the labor force status of the population, the critical cell is the size of the labor force of the particular population group. In all other tables, the determining factor or critical cell is the size of the base of the distribution,i.e., the size of total employment or unemployment for that area or population subgroup. Data are not published for any cell with fewer than 500 persons or less than 0.5 percent.

Using the sampling error tables

Tables B-2 through B-37 provide sampling errors at the 90-percent confidence level (1.6 times one standard error) for major labor force characteristics. They indicate the order of magnitude of the sampling error rather than the precise amount of the possible error in an estimate.

Table B-14 shows that an estimate of 50,000 unemployed persons (total or white) in Alabama will have an absolute sampling error of 11,000, and a relative sampling error of 22 percent, while an estimate of 100,000 unemployed persons in Alabama has an absolute sampling error of 15,000 and a relative sampling error of 15 percent.

The statement that unemployment in Alabama is between 39,000 and 61,000 in the first instance, and between 85,000 and 115,000 in the second, is made with 90-percent confidence. If repeated samples were drawn from the same population and a confidence interval (based on the sample estimate plus and minus the sampling error) were constructed for each sample estimate, the true value based on a complete census of the population would be contained within 90 percent of these intervals. Hence, we can be 90-percent confident that the interval constructed does, in fact, contain the true value.

To calculate a 68-percent interval (two chances out of three), multiply the sampling error shown by 0.63. To convert the sampling error to 95-percent confidence (19 chances out of 20), multiply the sampling error by 1.23. For the example given above, the sampling error at 90-percent confidence was 11,000. At 68-percent confidence, the error would be about 6,900 (11,000 x 0.63 = 6,930). At 95-percent confidence, the error would be about 13,500 (11,000 x 1.23 = 13,530).

To compute the error of a difference from the tables, an additional step is required. If, for instance, one wishes to know whether a change in the unemployment rate from 1985 to 1986 in a particular area is statistically significant, or whether the difference in the unemployment rate between two areas or population groups is statistically meaningful, the significance of the difference needs to be computed.

To test for the significance of a difference, the following formula should be used:

$$E_d = \sqrt{E_1^2 + E_2^2 - C}$$

where: E_1 = the sampling error of one group or year

E_2 = the sampling error of another group or year

C = the covariance (or relationship) term between E_1 and E_2

E_d = the sampling error of the difference

The E_1 and the E_2 must be found in the appropriate *Geographic Profile* for each year, since the size of the samples and, consequently, sampling errors may differ from year to year. Estimates for the "C" term for areas in this bulletin are not available. (If the relationship between the two groups or years is small, the "C" term may be ignored. If, however, there is a strong positive relationship between the two groups, then the error computed without the "C" term will be overstated.) An example will show how this significance test is applied. Suppose one wished to know whether a hypothetical

change in the CPS unemployment rate in Alaska from 10.0 percent in 1985 to 8.0 percent in 1986 is significant. Assume that the labor force was about 100,000 in both years. Table B-20 in the 1985 *Geographic Profile* gives the error for a 10.0-percent unemployment rate as 1.28, and table B-20 in this year's *Geographic Profile* gives the error for an 8.0-percent unemployment rate as 1.23. Using the formula described above, the following would result:

$$E_1 = 1.28 \quad E_2 = 1.23$$

$$E_1^2 + E_2^2 = 3.151$$

$$\sqrt{3.151} = 1.78$$

Assuming a negligible "C" term, the error of the difference is about 1.8. Since the actual change (2.0 percent) exceeds the error of the difference, it can be stated, with 90-percent confidence, that the difference in rates is attributable to factors other than sampling error alone.

To derive a sampling error for a given estimate, it may be necessary to use interpolation or extrapolation. For example, table B-14 contains no sampling error for an estimate of 150,000 unemployed persons in Alabama. The following formula shows how to interpolate for an estimate of 150,000 in Alabama:

$$E_s = [[(S-G) / (F-G)] \times (X-Y)] + Y$$

where: F = published size immediately above the size desired (200,000)

G = published size immediately below the size desired (100,000)

S = size desired (150,000)

X = error of the F (21,000)

Y = error of the G (15,000)

E = error of the S (18,000)

If the sample estimate lies outside the boundaries of the error tables, extrapolation can be used to approximate the sampling error. The formula for extrapolation is the same as that for interpolation; however, the "F" term is the highest value in the table and the "G" term becomes the next highest value.

Derivation of sampling errors

These State and area sampling errors are developed using a generalized procedure and are not based on the sample data for each individual area. As with all sampling error tables produced for CPS State and area data, a number of approximations were required in order to derive sampling errors that would be applicable to a wide variety of items. As a result, these sampling errors provide an indication of the order of magnitude of a sampling error rather than a precise sampling error for any specific item. The sampling error tables are derived from standard error equations and special parameters developed by the Bureau of the Census. These may be obtained from BLS upon request.

Tables:

B- 1. Minimum bases required for publication of State, Census region and division, and metropolitan area data 135

Sampling errors at the 90-percent confidence level by Census region and division:

B- 2. Estimated numbers of unemployed total or white persons 136
B- 3. Estimated numbers of unemployed black persons 136
B- 4. Estimated numbers of unemployed persons of Hispanic origin 136
B- 5. Estimated labor force and employment numbers for total or white persons 137
B- 6. Estimated labor force and employment numbers for black persons 138
B- 7. Estimated labor force and employment numbers for persons of Hispanic origin 138
B- 8. Estimated unemployment rates for total or white persons 140
B- 9. Estimated unemployment rates for black persons 141
B-10. Estimated unemployment rates for persons of Hispanic origin 143
B-11. Civilian labor force participation rates for total or white persons 144
B-12. Civilian labor force participation rates for black persons 146
B-13. Civilian labor force participation rates for persons of Hispanic origin 148

Sampling errors at the 90-percent confidence level by State:

B-14. Estimated numbers of unemployed total or white persons 150
B-15. Estimated numbers of unemployed black persons 151
B-16. Estimated numbers of unemployed persons of Hispanic origin 152
B-17. Estimated labor force and employment numbers for total or white persons 153
B-18. Estimated labor force and employment numbers for black persons 155
B-19. Estimated labor force and employment numbers for persons of Hispanic origin 156
B-20. Estimated unemployment rates for total or white persons 158
B-21. Estimated unemployment rates for black persons 161
B-22. Estimated unemployment rates for persons of Hispanic origin 163
B-23. Civilian labor force participation rates for total or white persons 165
B-24. Civilian labor force participation rates for black persons 169
B-25. Civilian labor force participation rates for persons of Hispanic origin 172

Sampling errors at the 90-percent confidence level for selected metropolitan areas and cities:

B-26. Estimated numbers of unemployed total or white persons 175
B-27. Estimated numbers of unemployed black persons 176
B-28. Estimated numbers of unemployed persons of Hispanic origin 177
B-29. Estimated labor force and employment numbers for total or white persons 178
B-30. Estimated labor force and employment numbers for black persons 179
B-31. Estimated labor force and employment numbers for persons of Hispanic origin 180
B-32. Estimated unemployment rates for total or white persons 182
B-33. Estimated unemployment rates for black persons 185
B-34. Estimated unemployment rates for persons of Hispanic origin 187
B-35. Civilian labor force participation rates for total or white persons 189
B-36. Civilian labor force participation rates for black persons 192
B-37. Civilian labor force participation rates for persons of Hispanic origin 194

Appendix C. Geographic Boundary Definitions

Table C-1 of this appendix lists the States composing the Census regions and divisions for which data are published in section I. Table C-2 provides the geographic definitions of the metropolitan areas for which data are published in section III.

Beginning with 1986 annual averages in this publication, data for metropolitan areas reflect revised standards and definitions established by the U. S. Office of Management and Budget effective June 30, 1983.[1]

Nature of the revisions

During the revision process, new statistical areas were established, many area titles were changed, and geographic boundaries were redefined primarily on the basis of 1980 census information. In addition, several changes were made in the terminology used in describing metropolitan areas. Whereas only two categories of metropolitan areas were designated previously—Standard Metropolitan Statistical Areas and Standard Consolidated Statistical Areas—there are now three categories—Metropolitan Statistical Areas (the word "Standard" was deleted from all designations), Primary Metropolitan Statistical Areas, and Consolidated Metropolitan Statistical Areas.

A *Metropolitan Statistical Area (MSA)* is an urban area that meets specified size criteria—either it has a city of at least 50,000 inhabitants within its corporate limits, or it contains an urbanized area of at least 50,000 inhabitants and has a total population of at least 100,000.

A *Primary Metropolitan Statistical Area (PMSA)* is an urban area within a very large metropolitan area. A PMSA either was recognized as a separate metropolitan area as of January 1, 1980, or has a population of at least 100,000 with at least 60 percent of the population urban and less than 50 percent of the resident workers commuting to jobs outside the area.

A *Consolidated Metropolitan Statistical Area (CMSA)* is a combination of contiguous metropolitan areas. It is defined as a metropolitan area which has a population of at least 1 million and which contains two or more PMSA's. The CMSA comprises the entire geographical area of its constituent PMSA's—all counties (in New England, cities and towns) must be included in the PMSA's.

Effect of the revisions

Table C-2 summarizes the effect of revisions on published data. As indicated, out of the 30 areas for which data were published in the 1985 and earlier editions of *Geographic Profile*, 16 underwent geographic definitional changes, 5 had title changes only, and 9 were unchanged. Two areas, New York and Minneapolis-St Paul, which were previously designated Labor Market Areas (LMA's) for various administrative and programmatic purposes, have been redefined as a PMSA and an MSA, respectively.

Twenty new areas have been added to the published tables. These include 14 MSA's, 4 PMSA's, and 2 CMSA's. One PMSA—Oakland, California—was previously defined as a component of the San Francisco-Oakland SMSA.

[1] The standards were published in the Federal Register on January 3, 1980; the definitions and a complete listing of the areas were published on June 27, 1983 in OMB release 83-20. The definitions and a complete listing of the metropolitan areas are also available on microfiche (PB86-199742) from the National Technical Information Service (NTIS), U.S. Department of Commerce, 5285 Port Royal Road, Springfield, Virginia 22151.

Table C-1. State composition of the Census regions and divisions

Region and division	State
Northeast:	
New England	Connecticut
	Maine
	Massachusetts
	New Hampshire
	Rhode Island
	Vermont
Middle Atlantic	New Jersey
	New York
	Pennsylvania
Midwest:	
East North Central	Illinois
	Indiana
	Ohio
	Michigan
	Wisconsin
West North Central	Iowa
	Kansas
	Minnesota
	Missouri
	Nebraska
	North Dakota
	South Dakota
South:	
South Atlantic	Delaware
	District of Columbia
	Florida
	Georgia
	Maryland
	North Carolina
	South Carolina
	Virginia
	West Virginia
East South Central	Alabama
	Kentucky
	Mississippi
	Tennessee
West South Central	Arkansas
	Louisiana
	Oklahoma
	Texas
West:	
Mountain	Arizona
	Colorado
	Idaho
	Montana
	Nevada
	New Mexico
	Utah
	Wyoming
Pacific	Alaska
	California
	Hawaii
	Oregon
	Washington

Table C-2. Geographic boundaries of metropolitan areas

State and area	Type of area	Definition	Change from 1985 Geographic Profile
Arizona			
Phoenix	MSA	Maricopa County	New area
California			
Anaheim–Santa Ana	PMSA	Orange County	Was previously titled Anaheim–Santa Ana–Garden Grove.
Los Angeles–Long Beach	PMSA	Los Angeles County	No change
Oakland	PMSA	Alameda and Contra Costa Counties	New area
Riverside–San Bernardino	PMSA	Riverside and San Bernardino Counties	Was previously titled Riverside–San Bernardino–Ontario.
Sacramento	MSA	El Dorado, Placer, Sacramento, and Yolo Counties	New area
San Diego	MSA	San Diego County	No change
San Francisco	PMSA	Marin, San Francisco, and San Mateo Counties	Was previously titled San Francisco–Oakland; deleted Alameda and Contra Costa Counties.
San Jose	PMSA	Santa Clara County	No change
Colorado			
Denver–Boulder	CMSA	Adams, Arapahoe, Boulder, Denver, Douglas and Jefferson Counties	Deleted Gilpin County.
Connecticut			
Hartford–New Britain–Middletown	CMSA	Bristol, Hartford, and New Britain cities and Aron, Berlin, Bloomfield, Burlington, Canton, East Granby, East Hartford, East Windsor, Enfield, Farmington, Glastonbury, Granby, Manchester, Marlborough, Newington, Plainville, Rocky Hill, Simsburg, Southington, South Windsor, Suffield, West Hartford, Wethersfield, Windsor, and Windsor Locks towns in Hartford County; Barkhamsted, New Hartford, and Plymouth towns in Litchfield County; Middletown city and Cromwell, Durham, East Haddam, East Hampton, Haddam, Middlefield, and Portland towns in Middlesex County; Colchester town in New London County, Andover, Bolton, Columbia, Coventry, Ellington, Hebron, Somers, Stafford, Tolland, Vernon, and Willington towns in Tolland County	New area
District of Columbia			
Washington	MSA	District of Columbia; Calvert, Charles, Frederick, Montgomery, and Prince Georges Counties, Md; Alexandria, Fairfax, Falls Church, Manassas, and Manassas Park cities, and Arlington, Fairfax, Loudon, Prince William, and Stafford Counties, Va.	Added Calvert and Frederick Counties, Maryland; and Stafford County, Virginia.
Florida			
Fort Lauderdale–Hollywood–Pompano Beach	PMSA	Broward County	New area
Miami–Hialeah	PMSA	Dade County	Was previously titled Miami.
Tampa–St. Petersburg–Clearwater	MSA	Hernando, Hillsborough, Pasco, and Pinellas Counties	New area
Georgia			
Atlanta	MSA	Barrow, Butts, Cherokee, Clayton, Cobb, Coweta, De Kalb, Douglas, Fayette, Forsyth, Fulton, Gwinnett, Henry, Newton, Paulding, Rockdale, Spaulding, and Walton Counties	Added Barrow, Coweta, and Spaulding Counties.
Illinois			
Chicago	PMSA	Cook, Du Page, and McHenry Counties	Deleted Kane, Lake, and Will Counties.
Indiana			
Indianapolis	MSA	Boone, Hamilton, Hancock, Hendricks, Johnson, Marion, Morgan, and Shelby Counties	No change
Kentucky			
Louisville	MSA	Bullitt, Jefferson, Oldham, and Shelby Counties, Ky; Clark, Floyd, and Harrison Counties, Ind.	New area
Louisiana			
New Orleans	MSA	Jefferson, Orleans, St. Bernard, St. Charles, St. John the Baptist, and St. Tammany Parishes	New area
Maryland			
Baltimore	MSA	Baltimore city, and Anne Arundel, Baltimore, Carroll, Harford, Howard, and Queen Anne's Counties	Added Queen Anne's County.

Table C-2. Geographic boundaries of metropolitan areas—Continued

State and area	Type of area	Definition	Change from 1985 Geographic Profile
Massachusetts			
Boston	PMSA	Mansfield, Norton, and Raynham towns in Bristol County; Lynn city and Lynnfield, Nahant, and Saugus towns in Essex County; Cambridge, Everett, Malden, Marlborough, Medford, Melrose, Newton, Somerville, Waltham, and Woburn cities, and Acton, Arlington, Ashland, Ayer, Bedford, Belmont, Boxborough, Burlington, Carlisle, Concord, Framingham, Groton, Holliston, Hopkinton, Hudson, Lexington, Lincoln, Littleton, Maynard, Natick, North Reading, Reading, Sherborn, Shirley, Stoneham, Stow, Sudbury, Townsend, Wakefield, Watertown, Wayland, Weston, Wilmington, and Winchester towns in Middlesex County; Quincy city, and Bellingham, Braintree, Brookline, Canton, Cohasset, Dedham, Dover, Foxborough, Franklin, Holbrook, Medfield, Medway, Millis, Milton, Needham, Norfolk, Norwood, Randolph, Sharon, Stoughton, Walpole, Wellesley, Westwood, Weymouth, and Wrentham towns in Norfolk County; Carver, Duxbury, Hanover, Hanson, Hingham, Hull, Kingston, Lakeville, Marshfield, Middleborough, Norwell, Pembroke, Plymouth, Plympton, Rockland, and Scituate towns in Plymouth County; Boston, Chelsea, and Revere cities and Winthrop town in Suffolk County; Berlin, Bolton, Harvard, Hopedale, Lancaster, Mendon, Milford, Southborough, and Upton towns in Worcester County	Added: Mansfield, Norton, and Raynham towns in Bristol County; Marlborough city and Ayer, Groton, Hopkington, Hudson, Littleton, Maynard, Shirley, Stow, and Townsend towns in Middlesex County; Carver, Lakeville, Middleborough, Plymouth, and Plympton towns in Plymouth County; Berlin, Bolton, Harvard, Hopedale, Lancaster, Mendon, Milford, Southborough, and Upton towns in Worcester County. Deleted: Beverly, Peabody, and Salem cities; Boxford, Danvers, Hamilton, Manchester, Marblehead, Middleton, Swampscott, Topsfield, and Wenham towns in Essex County and Abington town in Plymouth County.
Michigan			
Detroit	PMSA	Lapeer, Livingston, Macombe, Monroe, Oakland, St. Clair, and Wayne Counties	Added Monroe County.
Minnesota			
Minneapolis–St. Paul	MSA	Anoka, Carver, Chisago, Dakota, Hennepin, Isanti, Ramsey, Scott, Washington, and Wright Counties, Minn.; St. Croix County, Wis.	Added Isanti County; was previously designated a Labor Market Area (LMA) which included St. Croix County.
Missouri			
Kansas City	MSA	Johnson, Leavenworth, Miami, and Wyandotte Counties, Kan.; Cass, Clay, Jackson, Lafayette, Platte, and Ray Counties, Mo.	Added Lafayette County in Missouri and Leavenworth Counties in Kansas.
St. Louis	MSA	Clinton, Jersey, Madison, Monroe, and St. Clair Counties, Ill.; St. Louis city, and Franklin, Jefferson, St. Charles and St. Louis Counties, Mo.	Added Jersey County.
New Jersey			
Bergen–Passaic	PMSA	Bergen and Passaic Counties	New area
Newark	PMSA	Essex, Morris, Sussex, and Union Counties	Added Sussex County; deleted Somerset County.
New York

Bulletin 2305

For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402

Preface

Data on labor force, employment, and unemployment in State and sub-State areas are available from two major sources—the Current Population Survey (CPS) and the Federal-State Cooperative Program.

This bulletin presents 1987 annual averages from the CPS, a nationwide sample survey of about 59,500 households, for Census regions, States, 50 large metropolitan areas, and 17 cities. Included are data for the employed and unemployed by selected demographic and economic characteristics.

Comparable data for 1980–86 were published in previous issues of *Geographic Profile of Employment and Unemployment* as follows: 1986, Bulletin 2279; 1985, Bulletin 2266; 1984, Bulletin 2234; 1983 Bulletin 2216; 1982, Bulletin 2170; and 1981 and 1980, Bulletin 2156. Bulletin 2156 also provided instructions for adjusting 1970 census-based data for earlier years to reflect 1980 census population counts.

The Federal-State Cooperative Program provides monthly estimates for all but the 11 largest States, metropolitan areas, and cities, which are the official monthly labor force series and the basis for determining the eligibility of an area for benefits under Federal economic assistance programs. (The Current Population Survey provides data for the 11 largest States.) The estimates are prepared by the employment security agency in each State, using concepts, definitions, and estimation procedures established by BLS. Under this program, annual average labor force estimates for all States, the District of Columbia, the Los Angeles Metropolitan Statistical Area, and New York City are obtained directly from the CPS and are identical to those published in this bulletin. Annual average estimates for the remaining metropolitan areas and cities, however, are derived using BLS estimation procedures. These annual average estimates for 1987 will appear in the May 1988 issue of *Employment and Earnings* and in the annual report, *Unemployment in States and Local Areas.*

Labor force, employment, and unemployment data from the CPS for metropolitan areas and cities are shown in tables 23–27 of this bulletin. **They differ from the official estimates produced through the Federal-State Cooperative Program.** They are provided because they are the only current source of information on demographic and economic characteristics of these areas.

This bulletin was prepared by the Data Users' and Publication Services Group and the Data Services Group in collaboration with the Division of Local Area Unemployment Statistics.

Material in this publication is in the public domain and, with appropriate credit, may be reproduced without permission.

Geographic Profile of Employment and Unemployment, 1987

The Current Population Survey (CPS) is the regular monthly survey of about 59,500 households from which the national unemployment rate is derived. (See appendix A for concepts and definitions used in the CPS, and appendix B for a description of the estimation procedure.)

Annual average estimates of the labor force by demographic characteristics (age, sex, race, and Hispanic origin) and economic characteristics of the employed and unemployed are published in this bulletin only if they meet the BLS standards of reliability for publication. (See appendix B for an explanation of the BLS standards for CPS data.) Estimates for census regions and divisions are shown in section I; States are shown in section II; and metropolitan areas and cities are shown in section III.

Since the estimates are based on a survey rather than on a complete census of the population, they are subject to sampling error. Consequently, error ranges have been provided, at a 90-percent confidence interval, for the unemployment rates in the first table of section I, II, and III. In addition, appendix B provides tables from which the sampling error ranges can be obtained from the data in other tables in these sections.

Other marital status[3]	4,860	2,800	57.6	2,621	53.9	179	6.4	5.8 - 7.0

[1] Error ranges are calculated at the 90-percent confidence interval, which means that if repeated samples were drawn from the same population and an error range constructed around each sample estimate, in 9 out of 10 cases the true value based on a complete census of the population would be contained within these error ranges.

[2] Because of separate processing and weighting procedures, totals for the United States differ from the results obtained by aggregating the totals for regions and States.

[3] "Other marital status" includes divorced, widowed, separated, and married with spouse absent.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

[1] Employed persons with a job but not at work are distributed according to whether they usually work full- or part-time.

[2] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in that area. See appendix B.

NOTE: Items may not add to totals because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

[1] Excludes persons with no previous work experience.

[2] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in that area. See appendix B.

[3] Less than 500 persons or less than 0.05 percent.

NOTE: Items may not add to totals or compute to displayed rates because of rounding.

Farm operators and managers	[1]	.2	[1]	.1	.1	.1	.2	1	[2]	.3	.4	.5	.3

[1] Less than 500 persons employed or less than 0.05 percent of total employed.

[2] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in that area. See appendix B.

NOTE: Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

[1] Includes toys, amusement, and sporting goods.

[2] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in that area. See appendix B.

[3] Less than 500 persons employed or less than 0.05 percent of total employed.

NOTE: Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Other marital status[2]	60	36	60.9	32	54.4	4	10.7	8.3 - 13.2

[1] Error ranges are calculated at the 90-percent confidence interval, which means that if repeated samples were drawn from the same population and an error range constructed around each sample estimate, in 9 out of 10 cases the true value based on a complete census of the population would be contained within these error ranges.

[2] "Other marital status" includes divorced, widowed, separated, and married with spouse absent.

[3] Less than 500 persons or less than 0.05 percent.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

[1] Employed persons with a job but not at work are distributed according to whether they usually work full- or part time.

[2] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in that area. See appendix B.

NOTE: Items may not add to totals because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Table 14. States: Employment status of the experienced[1] civilian labor force by occupation, 1987 annual averages

(Numbers in thousands)

Employment status and State	Total	Managerial and professional specialty		Technical, sales, and administrative support			Service occupations	Precision production, craft, and repair	Operators, fabricators, and laborers			Farming, forestry, and fishing
		Executive, administrative, and managerial	Professional specialty	Technicians and related support	Sales	Administrative support, including clerical			Machine operators, assemblers, and inspectors	Transportation and material moving	Handlers, equipment cleaners, helpers, and laborers

[1] Less than 500 persons employed or less than 0.05 percent of total employed

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Table 16. States: Employment status of the experienced[1] civilian labor force by industry, 1987 annual averages

(Numbers in thousands)

Employment status and State	Total[2]	Nonagricultural industries										Agriculture
		Total[3]	Private nonagricultural wage and salary workers								Government	
			Total[4]	Construction	Manufacturing			Transportation, communications, and public utilities	Trade	Finance, insurance, and real estate	Services[5]		
					Total	Durable goods	Nondurable goods

[1] Excludes persons with no previous work experience.

[2] Includes private household workers, self-employed and unpaid family workers, and mining.

[3] Includes self-employed and unpaid family workers and mining.

[4] Includes mining.

[5] Excludes private household workers.

[6] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in that area. See appendix B.

[7] Less than 500 persons or less than 0.05 percent.

NOTE: Items may not add to totals or compute to displayed rates because of rounding.

[1] Includes private household workers, self-employed and unpaid family workers, and mining.
[2] Includes self-employed and unpaid family workers and mining.
[3] Includes mining.
[4] Excludes private household workers.
[5] Less than 500 persons employed or less than 0.05 percent of total employed

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Wyoming	10	1	2	1	6	[2]	3	1	2	35.1	43.2

[1] Refers to persons who worked 35 hours or more during the survey week.

[2] Less than 500 persons or less than 0.05 percent.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Table 19. States: Civilians at work 1 to 34 hours by sex, race, reason for working less than 35 hours, and usual status, 1987 annual averages

Florida	44	100.0	51.2	9.3	20.6	20.3	7.8
New York	67	100.0	52.0	15.4	13.2	19.7	15.1
Texas	200	100.0	49.8	4.4	10.1	24.4	15.7

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Table 22. States: Percent distribution of unemployed persons by sex, age, race, Hispanic origin, and duration of unemployment, 1987 annual averages

Texas	152	100.0	38.8	30.2	31.0	16.3
Hispanic origin						
California	226	100.0	50.8	29.1	20.1	9.1
Florida	44	100.0	54.8	26.7	18.6	9.6
New York	67	100.0	42.6	32.6	24.8	13.2
Texas	200	100.0	48.0	28.5	23.5	10.9

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Section III. Estimates for Metropolitan Areas and Cities

Labor force, employment, and unemployment data from the CPS for metropolitan areas and cities shown in tables 23–27 differ from the estimates produced through the Federal-State Cooperative Program.

Table 23. Selected metropolitan areas and cities: Employment status of the civilian noninstitutional population by sex, age, race, Hispanic origin, and marital status, 1987 annual averages

(Numbers in thousands)

Area and population group	Civilian non-institutional population	Civilian labor force		Employment		Unemployment		
		Number	Percent of population	Number	Percent of population	Number	Rate	Error range of rate[1]

Married, spouse present	285	197	69.0	187	65.4	10	5.2	3.1 - 7.4
Other marital status[2]	121	67	55.3	64	53.1	3	4.0	.8 - 7.2

[1] Error ranges are calculated at the 90-percent confidence interval, which means that if repeated samples were drawn from the same population and an error range constructed around each sample estimate, in 9 out of 10 cases the true value based on a complete census of the population would be contained within these error ranges.

[2] "Other marital status" includes divorced, widowed, separated, and married with spouse absent.

[3] Less than 500 persons or less than 0.05 percent.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Table 24. Selected metropolitan areas and cities: Employment status of the experienced[1] civilian labor force by occupation, 1987 annual averages

(Numbers in thousands)

Employment status and area	Total	Managerial and professional specialty		Technical, sales, and administrative support			Service occupations	Precision production, craft, and repair	Operators, fabricators, and laborers		
		Executive, administrative, and managerial	Professional specialty	Technicians and related support	Sales	Administrative support, including clerical			Machine operators, assemblers, and inspectors	Transportation and material moving	Handlers, equipment cleaners, helpers, and laborers

San Francisco	6.5	2.4	2.0	[3]	7.2	5.7	9.0	[3]	[3]	[3]	[3]

[1] Excludes persons with no previous work experience.

[2] All are Metropolitan Statistical Areas (MSA's) except those labeled Consolidated Metropolitan Statistical Areas (CMSA's) or Primary Metropolitan Statistical Areas (PMSA's). The differences are discussed in appendix C, "Geographic Boundary Definitions".

[3] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in that area. See appendix B.

[4] Less than 500 persons or less than 0.05 percent.

NOTE: Items may not add to totals or compute to displayed rates because of rounding.

[1] All are Metropolitan Statistical Areas (MSA's) except those labeled Consolidated Metropolitan Statistical Areas (CMSA's) or Primary Metropolitan Statistical Areas (PMSA's). The differences are discussed in appendix C, "Geographic Boundary Definitions".

[2] Less than 500 persons employed or less than 0.05 percent of total employed.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Table 26. Selected metropolitan areas and cities: Employment status of the experienced[1] civilian labor force for nonagricultural workers by industry, 1987 annual averages

(Numbers in thousands)

Employment status and area	Total[2]	Private nonagricultural wage and salary workers									Government
		Total[3]	Construction	Manufacturing			Transportation, communications, and public utilities	Trade	Finance, insurance, and real estate	Services[4]	
				Total	Durable goods	Nondurable goods

San Diego	4.8	5.9	([6])	4.8	([6])	([6])	([6])	7.6	([6])	6.6	2.2
San Francisco	6.5	7.4	([6])	([6])	([6])	([6])	([6])	9.9	([6])	5.3	4.8

[1] Excludes persons with no previous work experience.
[2] Includes self-employed and unpaid family workers and mining.
[3] Includes mining.
[4] Excludes private household workers.
[5] All are Metropolitan Statistical Areas (MSA's) except those labeled Consolidated Metropolitan Statistical Areas (CMSA's) or Primary Metropolitan Statistical Areas (PMSA's). The differences are discussed in appendix C, "Geographic Boundary Definitions".
[6] Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in that area. See appendix B.
[7] Less than 500 persons or less than 0.05 percent.

NOTE: Items may not add to totals or compute to displayed rates because of rounding.

[1] Includes self-employed and unpaid family workers and mining.
[2] Includes mining.
[3] Excludes private household workers.
[4] All are Metropolitan Statistical Areas (MSA's) except those labeled Consolidated Metropolitan Statistical Areas (CMSA's) or Primary Metropolitan Statistical Areas (PMSA's). The differences are discussed in appendix C, "Geographic Boundary Definitions".
[5] Less than 500 persons employed or less than 0.05 percent of total employed.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed percentages because of rounding. Detail for race and Hispanic-origin groups will not add to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

Appendix A. Concepts and Definitions for Data Derived from the Current Population Survey

Tables showing labor force status include provisional estimates of the civilian noninstitutional population 16 years and over as well as data on the civilian labor force, unemployment rates, and labor force participation rates. Population estimates are revised by the Bureau of the Census each year, and the revised estimates are incorporated into the CPS labor force levels. This adjustment affects the estimates of labor force, employment, and unemployment but does not affect percentages such as unemployment rates, participation rates, or employment-population ratios.

The *civilian labor force* comprises all civilians classified as employed or unemployed in accordance with the criteria described below.

The *employed* are all civilians who did any work as paid employees or in their own business during the survey week, or who worked 15 hours or more as unpaid workers in an enterprise operated by a family member. Persons temporarily absent from a job because of illness, bad weather, a strike, or for personal reasons are also counted as employed whether they were paid by their employer or were seeking other jobs.

The *unemployed* are all civilians who did not work during the survey week, made specific efforts to find a job in the prior 4 weeks, and were available for work during the survey week (except for temporary illness). Persons waiting to be recalled to a job from which they had been laid off, or waiting to report to a new job within 30 days, need not be looking for work to be classified as unemployed.

Duration of unemployment represents the length of time (through the current survey week) during which persons classified as unemployed have been continuously looking for work. For persons on layoff, duration of unemployment represents the number of full weeks since the termination of their most recent employment. A period of 2 weeks or more during which a person was employed or ceased looking for work is considered to break the continuity of the present period of jobseeking. Duration of unemployment measures the length of a spell of unemployment currently in progress. Hence, it should not be confused with a completed spell of unemployment.

Reasons for unemployment are divided into four major groups: (1) *Job losers* are persons whose employment ended involuntarily and who immediately began looking for work, and persons on layoff. (2) *Job leavers* are persons who quit or otherwise terminated their employment voluntarily and immediately began looking for work. (3) *Reentrants* are persons who previously worked at a full-time job lasting 2 weeks or longer but were out of the labor force before looking for work. (4) *New entrants* are persons who never worked at a full-time job lasting 2 weeks or longer.

The unemployment rate for all civilian workers represents the number unemployed as a percent of the civilian labor force.

The civilian labor force participation rate is the ratio of the civilian labor force to the civilian noninstitutional population.

The civilian employment-population ratio is the percentage of all employed civilians in the civilian noninstitutional population.

Hours of work statistics relate to the actual number of hours worked during the survey week. For example, persons who normally work 40 hours a week, but who were off on the Columbus Day holiday, would be reported as working 32 hours even though they were paid for the holiday. For persons working in more than one job, the figures relate to the number of hours worked in all jobs during the survey week, with all hours credited to the major job.

Persons who worked 35 hours or more in the survey week are designated as working *full time*; correspondingly, persons who worked between 1 and 34 hours are designated as working *part time*. Part-time workers are classified by their usual status at their present job (either full or part time) and by their reason for working part time during the survey week (economic or noneconomic). "Economic reasons" include: Slack work, material shortages, repairs to plant or equipment, start or termination of a job during the week, and inability to find full-time work. "Noneconomic reasons" include: Labor dispute, bad weather, own illness, vacation, demands of home, school, no desire for full-time work, and full-time worker only during the peak season. Persons on full-time schedules include, in addition to those working 35 hours or more, those who worked from 1 to 34 hours for noneconomic reasons and usually work full time.

The distribution of employment by hours worked relates to persons "at work" during the survey week. At-work data differ from data on total employment because the latter include persons in the zero-hours-worked category, "with a job but not at work." Included in this latter group are

persons who were on vacation, ill, involved in a labor dispute, or otherwise absent from their jobs for voluntary, noneconomic reasons. These persons are classified according to whether they usually work full or part time.

Occupation, industry, and class of worker data for the employed refer to the job held during the survey week. Persons with two jobs or more are classified according to the job in which they worked the most hours during the survey week. The unemployed are classified according to the last full-time civilian job held for 2 weeks or more. Beginning with 1983 data, all occupational and industry data presented in this bulletin are coded according to the classification systems used in the 1980 census, rather than the 1970 census systems used through 1982. While this conversion had little effect on industry-related data, the new occupational categories are so radically different that their implementation represents a break in historical data series. Additional information on the 1980 census occupational and industrial classification systems appears in "Revisions in the Current Population Survey Beginning in January 1983" in the February 1983 issue of *Employment and Earnings*.

Race and Hispanic origin. Beginning with 1981 annual averages, *Geographic Profile* presents racial data for white and black workers. Before 1981, racial data were published for white and "black and other" workers. The "other" category consists primarily of American Indians, Alaskan Natives, and Asians and Pacific Islanders.

Hispanic origin refers to persons who identified themselves in the enumeration process as Mexican, Puerto Rican, Cuban, Central or South American, or of other Hispanic origin or descent. Persons of Hispanic origin may be of any race; thus they are included in both the white and black population groups.

A more detailed description of the concepts and definitions used in the survey appears in *Concepts and Methods Used in Labor Force Statistics Derived from the Current Population Survey* (BLS Report 463) and the Explanatory Notes of the BLS monthly publication *Employment and Earnings*.

Appendix B. Sampling and Estimation Procedures and Sampling Error Tables

The estimates presented in this bulletin are based on annual averages of monthly data obtained from the CPS—a sample survey of the civilian noninstitutional population. The survey is conducted each month by the Bureau of the Census for BLS, and provides comprehensive data on the labor force, the employed, and the unemployed, including such characteristics as age, sex, race, Hispanic origin, marital status, occupation, and industry. The survey also provides data on the characteristics of those not in the labor force. The information is collected by trained interviewers from a scientifically selected sample designed to represent the civilian noninsitutional population. Each month, about 59,500 occupied housing units are eligible for interview. Respondents are interviewed using a standardized questionnaire to obtain information about the employment status of each household member 16 years of age and over. The reference period is the calendar week, Sunday through Saturday, which includes the 12th of the month. This is known as the survey week. Actual field interviewing is conducted during the week which includes the 19th of the month.

Inmates of institutions, members of the Armed Forces, and persons under 14 years of age are not covered in the regular monthly enumerations; data on members of the Armed Forces and persons under 16 are excluded from the population and labor force statistics shown in the bulletin.

Sampling procedures

The 1987 sample encompasses 729 sample areas comprising over 1,000 counties and cities, with coverage in every State and the District of Columbia. It is based to a large extent on information about the distribution of the population as reported in the 1980 decennial census. These areas were selected by dividing the entire area of the United States into 1,973 primary sampling units (PSU's). With some minor exceptions, a PSU consists of a county or number of contiguous counties. Most metropolitan areas constitute separate PSU's.

To improve the efficiency of the sample, the 1,973 PSU's were grouped into strata within each State. Then, one PSU was selected from each stratum, with the probability of selection proportionate to the population size in the PSU. PSU's in strata by themselves are self-representing, and generally are the most populated in each State. Other strata were formed by combining PSU's which were similar in such characteristics as population growth, proportion of blacks and Hispanics, occupation/industry, and age/sex distribution. PSU's selected from these strata are non-self-representing, since each one chosen represents the entire stratum.

Within each of the selected PSU's, the number of households to be enumerated each month is determined in two steps. First, a sample of census enumeration districts (ED's) is selected using the population size probability selection procedure. ED's are administrative units and contain, on the average, about 300 households. Second, clusters of approximately four addresses (contiguous wherever possible) are selected to be enumerated within each designated ED.

Part of the sample is changed, or rotated, each month. A primary reason for rotating the sample is to minimize the lack of cooperation which may result from interviewing a constant panel indefinitely. The rotation plan provides for three-fourths of the sample to be identical from one month to the next and one-half to be identical with the same month a year earlier.

Estimating methods

Under the estimating methods used, all of the results for a given month become available simultaneously and are based on returns from the entire panel of respondents. The estimation procedure involves the weighting up, or inflating, of the data from each sample person to develop estimates for the entire population from which the sample was drawn.

The basic weights, which are the inverse of the sampling ratios (defined as the number of sample households divided by total households in the State), are adjusted to better reflect the entire population, as described below.

1. *Noninterview adjustment.* The weights for all interviewed households are inflated to account for occupied sampled households for which no information was obtained because of impassable roads, refusals, unavailability of the respondent, or other reasons. The proportion of sample households not interviewed for these reasons generally varies from 4 to 5 percent.

2. *Ratio estimates.* The distribution of the population as estimated by the sample may differ somewhat each month, by chance, from that of the population as a whole in such characteristics as age, sex, ethnic origin, and residence. Since these characteristics are closely correlated with labor force participation and other principal measurements made from the sample, the latter estimates can be substantially improved when adjusted appropriately to conform to the known distribution of these population characteristics. This is accomplished through two stages of ratio estimation as follows:

a. *First-stage ratio estimate.* As explained above, non-self-representing PSU's are chosen to represent not only themselves, but also other unsampled areas. The first-stage ratio adjustment procedure is designed to correct for the differences that existed at the time of the the 1980 census between the distribution of the population by race in the non-self-representing sample areas and the corresponding distribution in the entire geographic area from which the non-self-representing areas were selected. The adjustment is made at the State level for each of the 43 States which contain non-self-representing areas by the race categories of black and non-black. The first-stage adjustment factors are derived using the non-self-representing PSU's in the sample, and hence, are recomputed only when a new PSU is rotated into the sample.

b. *Second-stage ratio estimate.* This stage is designed to adjust the inflated first-stage estimates to conform to the most recent distribution of the entire U.S. population by age-sex-race-Hispanic origin and is conducted in three steps.

In the first step, the sample population and the labor force estimates are adjusted within each State and the District of Columbia using an independent control for the population 16 years and over for that area. In effect, the ratio of the independent and sample population is used to inflate the sample labor force estimates. The second step involves an adjustment by Hispanic origin to a national estimate for eight age-sex categories by Hispanic and non-Hispanic origin.[1] In the third step, a national adjustment is made by the race categories of white, black, and other races to independent estimates by age and sex. The white and black categories contain 32 age-sex groups each while the other race category has 6 age-sex cells.

[1] Prior to January 1985, there was no separate control for Hispanics in the second-stage ratio estimation procedure. These controls are prepared by carrying forward the 1980 census count for Hispanics by adding estimated Hispanic births and immigrants and subtracting estimated Hispanic deaths and emigrants to yield an estimate of the Hispanic population by age and sex.

In addition, the second-stage ratio estimation procedure was revised in January 1986 to reflect an explicit allowance for net undocumented immigration (mostly Hispanic) since April 1, 1980 (the census date) and an increase in the estimate of emigration of legal foreign-born residents, also since 1980. The nature and effect of these changes on the labor force estimates are discussed in detail in "Changes in the Estimation Procedure in the Current Population Survey Beginning in January 1986" in the February 1986 issue of *Employment and Earnings.*

The entire second-stage ratio estimation procedure is iterated six times and, when completed, insures that the adjusted sample population estimates, both for the States and the national age-sex-Hispanic origin categories, will be virtually equal to the independent population estimates for these categories.

The monthly independent State controls for the civilian noninstitutional population 16 years and over are based on an arithmetic extrapolation of the trend in population growth using the two most recent July 1 estimates, with all State estimates prorated to a current estimate of the U.S. population. State estimates by age for July 1 are published annually in *Current Population Reports*, Series P-25. Descriptions of the methodology used in developing State totals and the age estimates are available in Reports 640 and 1010, respectively, of that series.

3. *Composite estimate procedure.* In deriving the statistics for a given month, a composite estimating procedure is used to take account of net changes in the sample results from the previous month for the continuing 75 percent of the households in the sample. It is a weighted average of the data from the current and previous months, and includes an additional term which is an estimate of the net difference between incoming and continuing parts of the current month's sample. Almost all estimates of month-to-month changes are improved by this procedure. Most estimates of levels are also improved, but to a lesser extent.

Reliability of the estimates

Since the estimates in this bulletin are based upon a sample of the population rather than a complete count, they may differ from the figures that would have been obtained if it had been possible to take a complete census using the same schedules and procedures as are used in the CPS. There are two types of errors in an estimate based on a sample survey—sampling and nonsampling. The sampling error tables in this report primarily indicate the magnitude of the sampling error. They also partially measure the effect of some nonsampling errors in response and enumeration, but do not measure any systematic biases in the data.

In general, the error of a sample estimate varies inversely with the size of the sample and directly with the size of the estimate. Hence, an estimate for a subgroup constituting a small proportion of a population will tend to have smaller absolute (and larger relative) error than an estimate for a subgroup constituting a large porportion of that same population.

Reliability standards

Since the CPS is designed to produce both national and State estimates, the proportion of the total population sampled and, hence, the sampling ratios differ among the States. In general, the smaller the population of the State, the larger the sampling proportion. For example, in Alaska approximately

1 in every 200 households was sampled each month in 1987 whereas in California the sample covered about 1 in every 2,200 households. Nevertheless, the size of the sample in California is 4 times larger than in Alaska because California has a larger percentage of the national population.

Differences in the probability of selecting each household in each State are necessary to obtain total unemployment levels meeting a minimum level of reliability—a maximum expected annual coefficient of variation of 10 percent, at one standard error, given a 6-percent unemployment rate. Before CPS labor force data for a State or area can be used as the official estimates in the Federal-State Cooperative Program, the size of the sample for that area must be large enough to produce estimates meeting that minimum standard of reliability.

Publication standards for State and area CPS data

In order to achieve comparability of the data for regions, divisions, States, metropolitan areas, and cities for publication purposes, a unique requirement for minimum labor force, employment, and unemployment had to be developed for each area. This requirement is based on the known differences in sampling ratios among these areas. Before estimates are published for a specific category, a predetermined "critical cell" must meet the comparable minimum publication standard for national CPS data. As a result of this requirement, minimum bases for publication have been developed for each area. Table B-1 lists the minimum necessary base for publication of data in each of the regions, divisions, States, the District of Columbia, and the metropolitan areas and cities appearing in this bulletin.

Estimates are not shown when they do not meet the minimum base for the State or area listed in table B-1. In tables showing the labor force status of the population, the critical cell is the size of the labor force of the particular population group. In all other tables, the determining factor or critical cell is the size of the base of the distribution, i.e., the size of total employment or unemployment for that area or population subgroup. Data are not published for any cell with fewer than 500 persons or less than 0.5 percent.

Using the sampling error tables

Tables B-2 through B-37 provide sampling errors at the 90-percent confidence level (1.6 times one standard error) for major labor force characteristics. They indicate the order of magnitude of the sampling error rather than the precise amount of the possible error in an estimate.

Table B-14 shows that an estimate of 50,000 unemployed persons (total or white) in Alabama will have an absolute sampling error of 11,000, and a relative sampling error of 22 percent. In comparison, an estimate of 100,000 unemployed persons in Alabama has an absolute sampling error of 15,000 and a relative sampling error of 15 percent.

The statement that unemployment in Alabama is between 39,000 and 61,000 in the first instance, and between 85,000 and 115,000 in the second, is made with 90-percent confidence. If repeated samples were drawn from the same population and a confidence interval (based on the sample estimate plus and minus the sampling error) were constructed for each sample estimate, the true value based on a complete census of the population would be contained within 90 percent of these intervals. Hence, we can be 90-percent confident that the interval constructed does, in fact, contain the true value.

To calculate a 68-percent interval (two chances out of three), multiply the sampling error shown by 0.63. To convert the sampling error to 95-percent confidence (19 chances out of 20), multiply the sampling error by 1.23. For the example given above, the sampling error at 90-percent confidence was 11,000. At 68-percent confidence, the error would be about 6,900 (11,000 x 0.63 = 6,930). At 95-percent confidence, the error would be about 13,500 (11,000 x 1.23 = 13,530).

To compute the error of a difference from the tables, an additional step is required. If, for instance, one wishes to know whether a change in the unemployment rate from 1985 to 1987 in a particular area is statistically significant, or whether the difference in the unemployment rate between two areas or population groups is statistically meaningful, the significance of the difference needs to be computed.

To test for the significance of a difference, the following formula should be used:

$$E_d = \sqrt{E_1^2 + E_2^2 - C}$$

where: E_1 = the sampling error of one group or year

E_2 = the sampling error of another group or year

C = the covariance (or relationship) term between E_1 and E_2

E_d = the sampling error of the difference.

The E_1 and the E_2 must be found in the appropriate *Geographic Profile* for each year, since the size of the samples and, consequently, sampling errors may differ from year to year. Estimates for the "C" term for areas in this bulletin are not available. (If the relationship between the two groups or years is small, the "C' term may be ignored. If, however, there is a strong positive relationship between the two groups, then the error computed without the "C" term will be overstated.) An example will show how this significance test is applied. Suppose one wished to know whether a hypothetical change in the CPS unemployment rate in Alaska from 10.0 percent in 1986 to 8.0 in 1987 is significant. Assume that the labor force was about 100,000 in both years. Table B-20 in the 1986 *Geographic Profile* gives the error for a 10.0-percent unemployment rate as 1.33, and table B-20 in this year's bulletin gives the error for an 8.0-percent unemployment rate as 1.23. Using the formula described above, the following would result:

$$E_1 = 1.33,\ E_2 = 1.23$$

$$E_1^2 + E_2^2 = 3.282$$

$$\sqrt{3.282} = 1.81$$

Assuming a negligible "C" term, the error of the difference is about 1.8. Since the actual change (2.0 percent) exceeds the error of the difference, it can be stated, with 90-percent confidence, that the difference in rates is attributable to factors other than sampling error alone.

To derive a sampling error for a given estimate, it may be necessary to use interpolation or extrapolation. For example, table B-14 contains no sampling error for an estimate of 150,000 unemployed persons in Alabama. The following formula shows how to interpolate for an estimate of 150,000 in Alabama:

$$E_s = [[(S-G) / (F-G)] \times (X-Y)] + Y$$

where: F = published size immediately above the size desired (200,000)

G = published size immediately below the size desired (100,000)

S = size desired (150,000)

X = error of the F (21,000)

Y = error of the G (15,000)

E = error of the S (18,000).

If the sample estimate lies outside the boundaries of the error tables, extrapolation can be used to approximate the sampling error. The formula for extrapolation is the same as that for interpolation; however, the "F" term is the highest value in the table and the "G" term becomes the next highest value.

Derivation of sampling errors

These State and area sampling errors are developed using a generalized procedure and are not based on the sample data for each individual area. As with all sampling error tables produced for CPS State and area data, a number of approximations were required in order to derive sampling errors that would be applicable to a wide variety of items. As a result, these sampling errors provide an indication of the order of magnitude of a sampling error rather than a precise sampling error for any specific item. The sampling error tables are derived from standard error equations and special parameters developed by the Bureau of the Census. These may be obtained from the BLS upon request.

Appendix C. Geographic Boundary Definitions

Table C-1 of this appendix lists the States composing the Census regions and divisions for which data are published in section I. Table C-2 provides the geographic definitions of the metropolitan areas for which data are published in section III.

Beginning with 1986 annual averages, data for metropolitan areas reflect revised standards and definitions established by the U.S. Office of Management and Budget, effective June 30, 1983.[1]

Definitions

A *Metropolitan Statistical Area (MSA)* is an urban area that meets specified size criteria—either it has a city of at least 50,000 inhabitants within its corporate limits, or it contains an urbanized area of at least 50,000 inhabitants and has a total population of at least 100,000.

A *Primary Metropolitan Statistical Area (PMSA)* is an urban area within a very large metropolitan area. A PMSA either was recognized as a separate metropolitan area as of January 1, 1980, or has a population of at least 100,000 with at least 60 percent of the population urban and less than 50 percent of the resident workers commuting to jobs outside the area.

A *Consolidated Metropolitan Statistical Area (CMSA)* is a combination of contiguous metropolitan areas. It is defined as a metropolitan area which has a population of at least 1 million and which contains two or more PMSA's. The CMSA comprises the entire geographical area of its constituent PMSA's—all counties (in New England, cities and towns) must be included in the PMSA's.

[1] The standards were published in the *Federal Register* on January 3, 1980; the definitions and a complete listing of the areas were published on June 27, 1983 in OMB release 83-20. The definintions and a complete listing of the metropolitan areas are also available on microfiche (PB86-199742) from the National Technical Information Service (NTIS), U.S. Department of Commerce, 5285 Port Royal Road, Springfield, VA 22151.

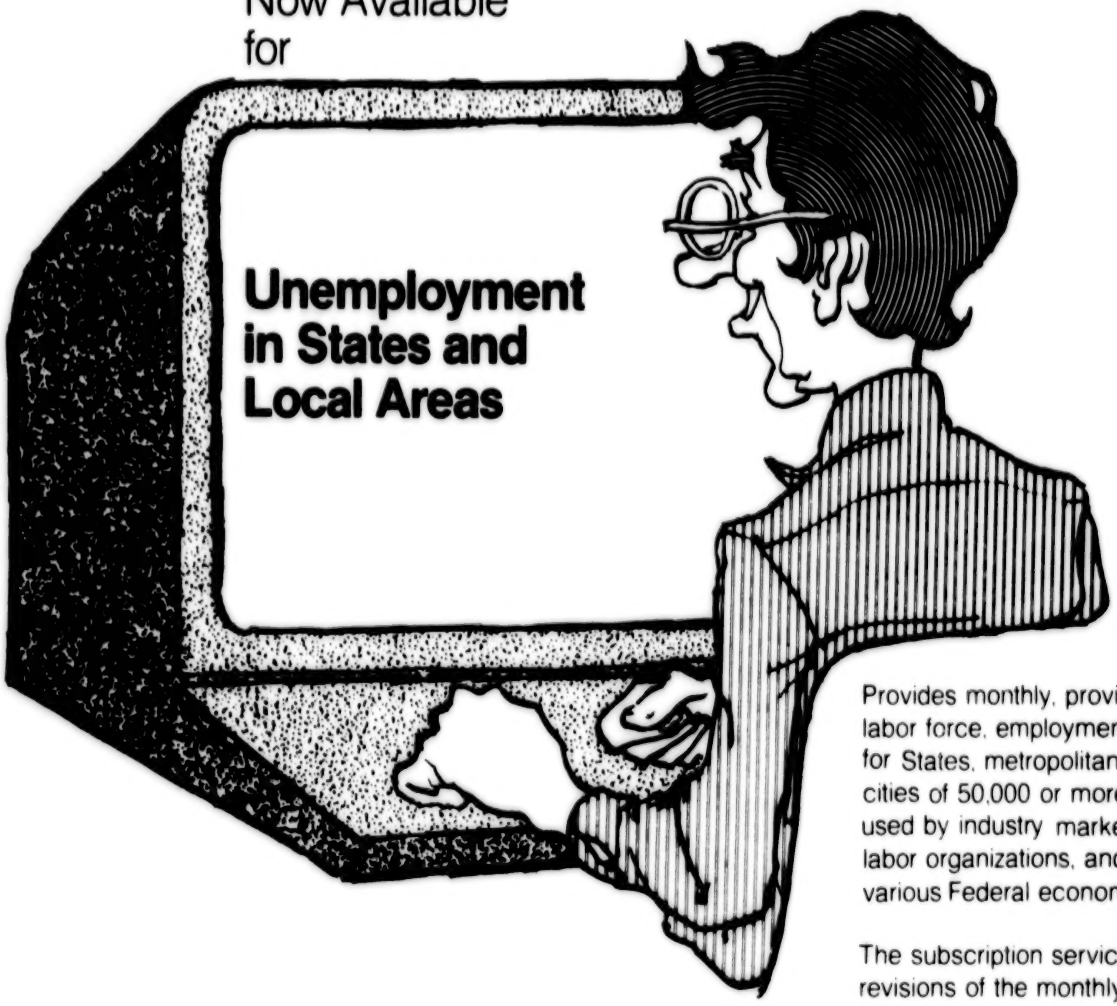
Table C-1. State composition of the Census regions and divisions

Region and division	State
Northeast:	
New England	Connecticut
	Maine
	Massachusetts
	New Hampshire
	Rhode Island
	Vermont
Middle Atlantic	New Jersey
	New York
	Pennsylvania
Midwest:	
East North Central	Illinois
	Indiana
	Ohio
	Michigan
	Wisconsin
West North Central	Iowa
	Kansas
	Minnesota
	Missouri
	Nebraska
	North Dakota
	South Dakota
South:	
South Atlantic	Delaware
	District of Columbia
	Florida
	Georgia
	Maryland
	North Carolina
	South Carolina
	Virginia
	West Virginia
East South Central	Alabama
	Kentucky
	Mississippi
	Tennessee
West South Central	Arkansas
	Louisiana
	Oklahoma
	Texas
West:	
Mountain	Arizona
	Colorado
	Idaho
	Montana
	Nevada
	New Mexico
	Utah
	Wyoming
Pacific	Alaska
	California
	Hawaii
	Oregon
	Washington

Table C-2. Geographic boundaries of metropolitan areas

State and area	Type of area	Definition
Arizona		
Phoenix	MSA	Maricopa County
California		
Anaheim-Santa Ana	PMSA	Orange County
Los Angeles-Long Beach	PMSA	Los Angeles County
Oakland	PMSA	Alameda and Contra Costa Counties
Riverside-San Bernardino	PMSA	Riverside and San Bernardino Counties
Sacramento	MSA	El Dorado, Placer, Sacramento, and Yalo Counties
San Diego	MSA	San Diego County
San Francisco	PMSA	Marin, San Francisco, and San Mateo Counties
San Jose	PMSA	Santa Clara County
Colorado		
Denver-Boulder	CMSA	Adams, Arapahoe, Boulder, Denver, Douglas and Jefferson Counties
Connecticut		
Hartford-New Britain-Middletown	CMSA	Bristol, Hartford, and New Britain cities and Aron, Berlin, Bloomfield, Burlington, Canton, East Granby, East Hartford, East Windsor, Enfield, Farmington, Glastonbury, Granby, Manchester, Marlborough, Newington, Plainville, Rocky Hill, Simsburg, Southington, South Windsor, Suffield, West Hartford, Wethersfield, Windsor, and Windsor Locks towns in Hartford County; Barkhamsted, New Hartford, and Plymouth towns in Litchfield County; Middletown city and Cromwell, Durham, East Haddam, East Hampton, Haddam, Middlefield, and Portland towns in Middlesex County; Colchester town in New London County, Andover, Bolton, Columbia, Coventry, Ellington, Hebron, Somers, Stafford, Tolland, Vernon, and Willington towns in Tolland County
District of Columbia		
Washington	MSA	District of Columbia; Calvert, Charles, Frederick, Montgomery, and Prince Georges Counties, Md; Alexandria, Fairfax, Falls Church, Manassas, and Manassas Park cities, and Arlington, Fairfax, Loudon, Prince William, and Stafford Counties, Va.
Florida		
Fort Lauderdale-Hollywood-Pompano Beach	PMSA	Broward County
Miami-Hialeah	PMSA	Dade County
Tampa-St. Petersburg-Clearwater	MSA	Hernando, Hillsborough, Pasco, and Pinellas Counties
Georgia		
Atlanta	MSA	Barrow, Butts, Cherokee, Clayton, Cobb, Coweta, De Kalb, Douglas, Fayette, Forsyth, Fulton, Gwinnett, Henry, Newton, Paulding, Rockdale, Spaulding, and Walton Counties
Illinois		
Chicago	PMSA	Cook, Du Page, and McHenry Counties
Indiana		
Indianapolis	MSA	Boone, Hamilton, Hancock, Hendricks, Johnson, Marion, Morgan, and Shelby Counties
Kentucky		
Louisville	MSA	Bullitt, Jefferson, Oldham, and Shelby Counties, Ky; Clark, Floyd, and Harrison Counties, Ind.
Louisiana		
New Orleans	MSA	Jefferson, Orleans, St. Bernard, St. Charles, St. John the Baptist, and St. Tammany Parishes
Maryland		
Baltimore	MSA	Baltimore city, and Anne Arundel, Baltimore, Carroll, Harford, Howard, and Queen Anne's Counties

Table C-2. Geographic boundaries of metropolitan areas—Continued



State and area	Type of area	Definition
Massachusetts		
Boston	PMSA	Mansfield, Norton, and Raynham towns in Bristol County; Lynn city and Lynnfield, Nahant, and Saugus towns in Essex County; Cambridge, Everett, Malden, Marlborough, Medford, Melrose, Newton, Somerville, Waltham, and Woburn cities, and Acton, Arlington, Ashland, Ayer, Bedford, Belmont, Boxborough, Burlington, Carlisle, Concord, Framingham, Groton, Holliston, Hopkinton, Hudson, Lexington, Lincoln, Littleton, Maynard, Natick, North Reading, Reading, Sherborn, Shirley, Stoneham, Stow, Sudbury, Townsend, Wakefield, Watertown, Wayland, Weston, Wilmington, and Winchester towns in Middlesex County; Quincy city, and Bellingham, Braintree, Brookline, Canton, Cohasset, Dedham, Dover, Foxborough, Franklin, Holbrook, Medfield, Medway, Millis, Milton, Needham, Norfolk, Norwood, Randolph, Sharon, Stoughton, Walpole, Wellesley, Westwood, Weymouth, and Wrentham towns in Norfolk County; Carver, Duxbury, Hanover, Hanson, Hingham, Hull, Kingston, Lakeville, Marshfield, Middleborough, Norwell, Pembroke, Plymouth, Plympton, Rockland, and Scituate towns in Plymouth County; Boston, Chelsea, and Revere cities and Winthrop town in Suffolk County; Berlin, Bolton, Harvard, Hopedale, Lancaster, Mendon, Milford, Southborough, and Upton towns in Worcester County
Michigan		
Detroit	PMSA	Lapeer, Livingston, Macombe, Monroe, Oakland, St. Clair, and Wayne Counties
Minnesota		
Minneapolis-St. Paul	MSA	Anoka, Carver, Chisago, Dakota, Hennepin, Isanti, Ramsey, Scott, Washington, and Wright Counties, Minn.; St. Croix County, Wis.
Missouri		
Kansas City	MSA	Johnson, Leavenworth, Miami, and Wyandotte Counties, Kan.; Cass, Clay, Jackson, Lafayette, Platte, and Ray Counties, Mo.
St. Louis	MSA	Clinton, Jersey, Madison, Monroe, and St. Clair Counties, Ill.; St. Louis city, and Franklin, Jefferson, St. Charles and St. Louis Counties, Mo.
New Jersey		
Bergen-Passaic	PMSA	Bergen and Passaic Counties
Newark	PMSA	Essex, Morris, Sussex, and Union Counties
New York		
Buffalo-Niagara Falls	CMSA	Erie and Niagara Counties
Nassau-Suffolk	PMSA	Nassau and Suffolk Counties
New York	PMSA	Bronx, Kings, New York, Putnam, Queens, Richmond, Rockland, and Westchester Counties
